DESCRIPTION

The TS902 is a RAIL TO RAIL dual CMOS operational amplifier designed to operate with single or dual supply voltage.
The input voltage range V_{icm} includes the two supply rails V_{CC}^+ and V_{CC}^-.
The output reaches :

- V_{CC}^- +50mV V_{CC}^+ -50mV with $R_L = 10k\Omega$
- V_{CC}^- +650mV V_{CC}^+ -650mV with $R_L = 600\Omega$

This product offers a broad supply voltage operating range from 2.7V to 16V and a supply current of only 400µA/amp. (V_{CC} = 10V).
Source and sink output current capability is typically 50mA (at V_{CC} = 10V), fixed by an internal limitation circuit.
The TS902 can be put on STANDBY position (only 1µA and high impedance outputs).

Notes : 1. All voltage values, except differential voltage are with respect to network ground terminal.
2. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
3. The magnitude of input and output voltages must never exceed V_{CC}^+ +0.3V.

STANDBY APPLICATION

The two operators of the TS902 are **both** put on **STANDBY.**

In this configuration (standby ON) :

- The **total consumption** of the circuit is considerably **reduced** down to 1µA (V_{CC} = 10V). This standby consumption versus V_{CC} curve is given figure 1b.
- The **both outputs** are in **high impedance** state. No output current can then be sourced or sinked by the device.

The standby pin 1 should never stay unconnected.

- The "**standby OFF**" state, is reached when the pin 1 voltage is **higher than** $V_{in\ SBY/OFF}$.
- The "**standby ON**" state is assured by a pin 1 voltage **lower than** $V_{in\ SBY/ON}$. (see electrical characteristics)
