For Texas Instruments synchronous serial frame format, the SSInFss pin is pulsed for one serial clock period starting at its rising edge, prior to the transmission of each frame. For this frame format, both the SSI and the off-chip slave device drive their output data on the rising edge of SSInClk and latch data from the other device on the falling edge.

Unlike the full-duplex transmission of the other two frame formats, the MICROWIRE format uses a special master-slave messaging technique which operates at half-duplex. In this mode, when a frame begins, an 8-bit control message is transmitted to the off-chip slave. During this transmit, no incoming data is received by the SSI. After the message has been sent, the off-chip slave decodes it and, after waiting one serial clock after the last bit of the 8-bit control message has been sent, responds with the requested data. The returned data can be 4 to 16 bits in length, making the total frame length anywhere from 13 to 25 bits.

#### 15.3.4.1 Texas Instruments Synchronous Serial Frame Format

Figure 15-2 on page 918 shows the Texas Instruments synchronous serial frame format for a single transmitted frame.

**Figure 15-2. TI Synchronous Serial Frame Format (Single Transfer)**

In this mode, SSInClk and SSInFss are forced Low, and the transmit data line SSInTx is tristated whenever the SSI is idle. Once the bottom entry of the transmit FIFO contains data, SSInFss is pulsed High for one SSInClk period. The value to be transmitted is also transferred from the transmit FIFO to the serial shift register of the transmit logic. On the next rising edge of SSInClk, the MSB of the 4 to 16-bit data frame is shifted out on the SSInTx pin. Likewise, the MSB of the received data is shifted onto the SSInRx pin by the off-chip serial slave device.

Both the SSI and the off-chip serial slave device then clock each data bit into their serial shifter on each falling edge of SSInClk. The received data is transferred from the serial shifter to the receive FIFO on the first rising edge of SSInClk after the LSB has been latched.

Figure 15-3 on page 919 shows the Texas Instruments synchronous serial frame format when back-to-back frames are transmitted.

**Figure 15-3. TI Synchronous Serial Frame Format (Continuous Transfer)**

#### 15.3.4.2 Freescale SPI Frame Format

The Freescale SPI interface is a four-wire interface where the SSInFss signal behaves as a slave select. The main feature of the Freescale SPI format is that the inactive state and phase of the SSInClk signal are programmable through the SPO and SPH bits in the **SSICR0** control register.

##### ***SPO Clock Polarity Bit***

When the SPO clock polarity control bit is clear, it produces a steady state Low value on the SSInClk pin. If the SPO bit is set, a steady state High value is placed on the SSInClk pin when data is not being transferred.

##### ***SPH Phase Control Bit***

The SPH phase control bit selects the clock edge that captures data and allows it to change state. The state of this bit has the most impact on the first bit transmitted by either allowing or not allowing a clock transition before the first data capture edge. When the SPH phase control bit is clear, data is captured on the first clock edge transition. If the SPH bit is set, data is captured on the second clock edge transition.

#### 15.3.4.3 Freescale SPI Frame Format with SPO=0 and SPH=0

Single and continuous transmission signal sequences for Freescale SPI format with SPO=0 and SPH=0 are shown in Figure 15-4 on page 920 and Figure 15-5 on page 920.

**Figure 15-4. Freescale SPI Format (Single Transfer) with SPO=0 and SPH=0**

**Note:** Q is undefined.

**Figure 15-5. Freescale SPI Format (Continuous Transfer) with SPO=0 and SPH=0**

In this configuration, during idle periods:

- SSInClk is forced Low
- SSInFss is forced High
- The transmit data line SSInTx is tristated
- When the SSI is configured as a master, it enables the SSInClk pad
- When the SSI is configured as a slave, it disables the SSInClk pad

If the SSI is enabled and valid data is in the transmit FIFO, the start of transmission is signified by the SSInFss master signal being driven Low, causing slave data to be enabled onto the SSInRx input line of the master. The master SSInTx output pad is enabled.

One half SSInClk period later, valid master data is transferred to the SSInTx pin. Once both the master and slave data have been set, the SSInClk master clock pin goes High after one additional half SSInClk period.

The data is now captured on the rising and propagated on the falling edges of the SSInClk signal.

In the case of a single word transmission, after all bits of the data word have been transferred, the SSInFss line is returned to its idle High state one SSInClk period after the last bit has been captured.

However, in the case of continuous back-to-back transmissions, the SSInFss signal must be pulsed High between each data word transfer because the slave select pin freezes the data in its serial peripheral register and does not allow it to be altered if the SPH bit is clear. Therefore, the master device must raise the SSInFss pin of the slave device between each data transfer to enable the serial peripheral data write. On completion of the continuous transfer, the SSInFss pin is returned to its idle state one SSInClk period after the last bit has been captured.

#### 15.3.4.4 Freescale SPI Frame Format with SPO=0 and SPH=1

The transfer signal sequence for Freescale SPI format with SPO=0 and SPH=1 is shown in Figure 15-6 on page 921, which covers both single and continuous transfers.

**Figure 15-6. Freescale SPI Frame Format with SPO=0 and SPH=1**

**Note:** Q is undefined.

In this configuration, during idle periods:

- SSInClk is forced Low
- SSInFss is forced High
- The transmit data line SSInTx is tristated
- When the SSI is configured as a master, it enables the SSInClk pad
- When the SSI is configured as a slave, it disables the SSInClk pad

If the SSI is enabled and valid data is in the transmit FIFO, the start of transmission is signified by the SSInFss master signal being driven Low. The master SSInTx output is enabled. After an additional one-half SSInClk period, both master and slave valid data are enabled onto their respective transmission lines. At the same time, the SSInClk is enabled with a rising edge transition.

Data is then captured on the falling edges and propagated on the rising edges of the SSInClk signal.

In the case of a single word transfer, after all bits have been transferred, the SSInFss line is returned to its idle High state one SSInClk period after the last bit has been captured.

For continuous back-to-back transfers, the SSInFss pin is held Low between successive data words, and termination is the same as that of the single word transfer.

#### 15.3.4.5 Freescale SPI Frame Format with SPO=1 and SPH=0

Single and continuous transmission signal sequences for Freescale SPI format with SPO=1 and SPH=0 are shown in Figure 15-7 on page 922 and Figure 15-8 on page 922.

**Figure 15-7. Freescale SPI Frame Format (Single Transfer) with SPO=1 and SPH=0**

**Note:** Q is undefined.

**Figure 15-8. Freescale SPI Frame Format (Continuous Transfer) with SPO=1 and SPH=0**

In this configuration, during idle periods:

- SSInClk is forced High
- SSInFss is forced High
- The transmit data line SSInTx is tristated
- When the SSI is configured as a master, it enables the SSInClk pad
- When the SSI is configured as a slave, it disables the SSInClk pad

If the SSI is enabled and valid data is in the transmit FIFO, the start of transmission is signified by the SSInFss master signal being driven Low, causing slave data to be immediately transferred onto the SSInRx line of the master. The master SSInTx output pad is enabled.

One-half period later, valid master data is transferred to the SSInTx line. Once both the master and slave data have been set, the SSInClk master clock pin becomes Low after one additional half

SSInClk period, meaning that data is captured on the falling edges and propagated on the rising edges of the SSInClk signal.

In the case of a single word transmission, after all bits of the data word are transferred, the SSInFss line is returned to its idle High state one SSInClk period after the last bit has been captured.

However, in the case of continuous back-to-back transmissions, the SSInFss signal must be pulsed High between each data word transfer because the slave select pin freezes the data in its serial peripheral register and does not allow it to be altered if the SPH bit is clear. Therefore, the master device must raise the SSInFss pin of the slave device between each data transfer to enable the serial peripheral data write. On completion of the continuous transfer, the SSInFss pin is returned to its idle state one SSInClk period after the last bit has been captured.

#### 15.3.4.6 Freescale SPI Frame Format with SPO=1 and SPH=1

The transfer signal sequence for Freescale SPI format with SPO=1 and SPH=1 is shown in Figure 15-9 on page 923, which covers both single and continuous transfers.

**Figure 15-9. Freescale SPI Frame Format with SPO=1 and SPH=1**

**Note:** Q is undefined.

In this configuration, during idle periods:

- SSInClk is forced High
- SSInFss is forced High
- The transmit data line SSInTx is tristated
- When the SSI is configured as a master, it enables the SSInClk pad
- When the SSI is configured as a slave, it disables the SSInClk pad

If the SSI is enabled and valid data is in the transmit FIFO, the start of transmission is signified by the SSInFss master signal being driven Low. The master SSInTx output pad is enabled. After an additional one-half SSInClk period, both master and slave data are enabled onto their respective transmission lines. At the same time, SSInClk is enabled with a falling edge transition. Data is then captured on the rising edges and propagated on the falling edges of the SSInClk signal.

After all bits have been transferred, in the case of a single word transmission, the SSInFss line is returned to its idle high state one SSInClk period after the last bit has been captured.

For continuous back-to-back transmissions, the SSInFss pin remains in its active Low state until the final bit of the last word has been captured and then returns to its idle state as described above.

For continuous back-to-back transfers, the SSInFss pin is held Low between successive data words and termination is the same as that of the single word transfer.

#### 15.3.4.7 MICROWIRE Frame Format

Figure 15-10 on page 924 shows the MICROWIRE frame format for a single frame. Figure 15-11 on page 925 shows the same format when back-to-back frames are transmitted.

**Figure 15-10. MICROWIRE Frame Format (Single Frame)**

MICROWIRE format is very similar to SPI format, except that transmission is half-duplex instead of full-duplex and uses a master-slave message passing technique. Each serial transmission begins with an 8-bit control word that is transmitted from the SSI to the off-chip slave device. During this transmission, no incoming data is received by the SSI. After the message has been sent, the off-chip slave decodes it and, after waiting one serial clock after the last bit of the 8-bit control message has been sent, responds with the required data. The returned data is 4 to 16 bits in length, making the total frame length anywhere from 13 to 25 bits.

In this configuration, during idle periods:

- SSInClk is forced Low
- SSInFss is forced High
- The transmit data line SSInTx is tristated

A transmission is triggered by writing a control byte to the transmit FIFO. The falling edge of SSInFss causes the value contained in the bottom entry of the transmit FIFO to be transferred to the serial shift register of the transmit logic and the MSB of the 8-bit control frame to be shifted out onto the SSInTx pin. SSInFss remains Low for the duration of the frame transmission. The SSInRx pin remains tristated during this transmission.

The off-chip serial slave device latches each control bit into its serial shifter on each rising edge of SSInClk. After the last bit is latched by the slave device, the control byte is decoded during a one clock wait-state, and the slave responds by transmitting data back to the SSI. Each bit is driven onto the SSInRx line on the falling edge of SSInClk. The SSI in turn latches each bit on the rising edge of SSInClk. At the end of the frame, for single transfers, the SSInFss signal is pulled High one clock period after the last bit has been latched in the receive serial shifter, causing the data to be transferred to the receive FIFO.

**Note:** The off-chip slave device can tristate the receive line either on the falling edge of SSInClk after the LSB has been latched by the receive shifter or when the SSInFss pin goes High.

For continuous transfers, data transmission begins and ends in the same manner as a single transfer. However, the SSInFss line is continuously asserted (held Low) and transmission of data occurs back-to-back. The control byte of the next frame follows directly after the LSB of the received data from the current frame. Each of the received values is transferred from the receive shifter on the falling edge of SSInClk, after the LSB of the frame has been latched into the SSI.

**Figure 15-11. MICROWIRE Frame Format (Continuous Transfer)**

In the MICROWIRE mode, the SSI slave samples the first bit of receive data on the rising edge of SSInClk after SSInFss has gone Low. Masters that drive a free-running SSInClk must ensure that the SSInFss signal has sufficient setup and hold margins with respect to the rising edge of SSInClk.

Figure 15-12 on page 925 illustrates these setup and hold time requirements. With respect to the SSInClk rising edge on which the first bit of receive data is to be sampled by the SSI slave, SSInFss must have a setup of at least two times the period of SSInClk on which the SSI operates. With respect to the SSInClk rising edge previous to this edge, SSInFss must have a hold of at least one SSInClk period.

**Figure 15-12. MICROWIRE Frame Format, SSInFss Input Setup and Hold Requirements**

### 15.3.5 DMA Operation

The SSI peripheral provides an interface to the  $\mu$ DMA controller with separate channels for transmit and receive. The  $\mu$ DMA operation of the SSI is enabled through the **SSI DMA Control (SSIDMACTL)** register. When  $\mu$ DMA operation is enabled, the SSI asserts a  $\mu$ DMA request on the receive or transmit channel when the associated FIFO can transfer data.

For the receive channel, a single transfer request is asserted whenever any data is in the receive FIFO. A burst transfer request is asserted whenever the amount of data in the receive FIFO is 4 or more items. For the transmit channel, a single transfer request is asserted whenever at least one empty location is in the transmit FIFO. The burst request is asserted whenever the transmit FIFO has 4 or more empty slots. The single and burst  $\mu$ DMA transfer requests are handled automatically by the  $\mu$ DMA controller depending how the  $\mu$ DMA channel is configured.

To enable  $\mu$ DMA operation for the receive channel, the RXDMAE bit of the **DMA Control (SSIDMACTL)** register should be set after configuring the  $\mu$ DMA. To enable  $\mu$ DMA operation for the transmit channel, the TXDMAE bit of **SSIDMACTL** should be set after configuring the  $\mu$ DMA. If  $\mu$ DMA is enabled, then the  $\mu$ DMA controller triggers an interrupt when a transfer is complete. The interrupt occurs on the SSI interrupt vector. Therefore, if interrupts are used for SSI operation and  $\mu$ DMA is enabled, the SSI interrupt handler must be designed to handle the  $\mu$ DMA completion interrupt.

When transfers are performed from a FIFO of the SSI using the  $\mu$ DMA, and any interrupt is generated from the SSI, the SSI module's status bit in the **DMA Channel Interrupt Status (DMACHIS)** register must be checked at the end of the interrupt service routine. If the status bit is set, clear the interrupt by writing a 1 to it.

See "Micro Direct Memory Access ( $\mu$ DMA)" on page 549 for more details about programming the  $\mu$ DMA controller.

## 15.4 Initialization and Configuration

To enable and initialize the SSI, the following steps are necessary:

1. Enable the SSI module using the **RCGCSSI** register (see page 327).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register (see page 321). To find out which GPIO port to enable, refer to Table 20-5 on page 1090.
3. Set the GPIO AFSEL bits for the appropriate pins (see page 635). To determine which GPIOs to configure, see Table 20-4 on page 1086.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the SSI signals to the appropriate pins. See page 652 and Table 20-5 on page 1090.
5. Program the **GPIODEN** register to enable the pin's digital function. In addition, the drive strength, drain select and pull-up/pull-down functions must be configured. Refer to "General-Purpose Input/Outputs (GPIOs)" on page 613 for more information.

**Note:** Pull-ups can be used to avoid unnecessary toggles on the SSI pins, which can take the slave to a wrong state. In addition, if the SSIClk signal is programmed to steady state High through the SP0 bit in the **SSICR0** register, then software must also configure the GPIO port pin corresponding to the SSIClk signal as a pull-up in the **GPIO Pull-Up Select (GPIOPUR)** register.

For each of the frame formats, the SSI is configured using the following steps:

1. Ensure that the SSE bit in the **SSICR1** register is clear before making any configuration changes.
2. Select whether the SSI is a master or slave:
  - a. For master operations, set the **SSICR1** register to 0x0000.0000.

- b. For slave mode (output enabled), set the **SSICR1** register to 0x0000.0004.
  - c. For slave mode (output disabled), set the **SSICR1** register to 0x0000.000C.
3. Configure the SSI clock source by writing to the **SSICC** register.
4. Configure the clock prescale divisor by writing the **SSICPSR** register.
5. Write the **SSICR0** register with the following configuration:
  - Serial clock rate (SCR)
  - Desired clock phase/polarity, if using Freescale SPI mode (SPH and SPO)
  - The protocol mode: Freescale SPI, TI SSF, MICROWIRE (FRF)
  - The data size (DSS)
6. Optionally, configure the SSI module for  $\mu$ DMA use with the following steps:
  - a. Configure a  $\mu$ DMA for SSI use. See “Micro Direct Memory Access ( $\mu$ DMA)” on page 549 for more information.
  - b. Enable the SSI Module's TX FIFO or RX FIFO by setting the TXDMAE or RXDMAE bit in the **SSIDMACTL** register.
7. Enable the SSI by setting the SSE bit in the **SSICR1** register.

As an example, assume the SSI must be configured to operate with the following parameters:

- Master operation
- Freescale SPI mode (SPO=1, SPH=1)
- 1 Mbps bit rate
- 8 data bits

Assuming the system clock is 20 MHz, the bit rate calculation would be:

$$\text{SSIClk} = \text{SysClk} / (\text{CPSDVSR} * (1 + \text{SCR}))$$

$$1 \times 10^6 = 20 \times 10^6 / (\text{CPSDVSR} * (1 + \text{SCR}))$$

In this case, if CPSDVSR=0x2, SCR must be 0x9.

The configuration sequence would be as follows:

1. Ensure that the SSE bit in the **SSICR1** register is clear.
2. Write the **SSICR1** register with a value of 0x0000.0000.
3. Write the **SSICPSR** register with a value of 0x0000.0002.
4. Write the **SSICR0** register with a value of 0x0000.09C7.
5. The SSI is then enabled by setting the SSE bit in the **SSICR1** register.

## 15.5 Register Map

Table 15-2 on page 928 lists the SSI registers. The offset listed is a hexadecimal increment to the register's address, relative to that SSI module's base address:

- SSI0: 0x4000.8000
- SSI1: 0x4000.9000
- SSI2: 0x4000.A000
- SSI3: 0x4000.B000

Note that the SSI module clock must be enabled before the registers can be programmed (see page 327). The Rn bit of the **PRSSI** register must be read as 0x1 before any SSI module registers are accessed.

**Note:** The SSI must be disabled (see the SSE bit in the **SSICR1** register) before any of the control registers are reprogrammed.

**Table 15-2. SSI Register Map**

| Offset | Name         | Type | Reset       | Description                     | See page |
|--------|--------------|------|-------------|---------------------------------|----------|
| 0x000  | SSICR0       | RW   | 0x0000.0000 | SSI Control 0                   | 930      |
| 0x004  | SSICR1       | RW   | 0x0000.0000 | SSI Control 1                   | 932      |
| 0x008  | SSIDR        | RW   | 0x0000.0000 | SSI Data                        | 934      |
| 0x00C  | SSISR        | RO   | 0x0000.0003 | SSI Status                      | 935      |
| 0x010  | SSICPSR      | RW   | 0x0000.0000 | SSI Clock Prescale              | 937      |
| 0x014  | SSIIM        | RW   | 0x0000.0000 | SSI Interrupt Mask              | 938      |
| 0x018  | SSIRIS       | RO   | 0x0000.0008 | SSI Raw Interrupt Status        | 939      |
| 0x01C  | SSIMIS       | RO   | 0x0000.0000 | SSI Masked Interrupt Status     | 941      |
| 0x020  | SSIICR       | W1C  | 0x0000.0000 | SSI Interrupt Clear             | 943      |
| 0x024  | SSIDMACTL    | RW   | 0x0000.0000 | SSI DMA Control                 | 944      |
| 0xFC8  | SSICC        | RW   | 0x0000.0000 | SSI Clock Configuration         | 945      |
| 0xFD0  | SSIPeriphID4 | RO   | 0x0000.0000 | SSI Peripheral Identification 4 | 946      |
| 0xFD4  | SSIPeriphID5 | RO   | 0x0000.0000 | SSI Peripheral Identification 5 | 947      |
| 0xFD8  | SSIPeriphID6 | RO   | 0x0000.0000 | SSI Peripheral Identification 6 | 948      |
| 0xFDC  | SSIPeriphID7 | RO   | 0x0000.0000 | SSI Peripheral Identification 7 | 949      |
| 0xFE0  | SSIPeriphID0 | RO   | 0x0000.0022 | SSI Peripheral Identification 0 | 950      |
| 0xFE4  | SSIPeriphID1 | RO   | 0x0000.0000 | SSI Peripheral Identification 1 | 951      |
| 0xFE8  | SSIPeriphID2 | RO   | 0x0000.0018 | SSI Peripheral Identification 2 | 952      |
| 0xFEC  | SSIPeriphID3 | RO   | 0x0000.0001 | SSI Peripheral Identification 3 | 953      |
| 0xFF0  | SSIPCellID0  | RO   | 0x0000.000D | SSI PrimeCell Identification 0  | 954      |
| 0xFF4  | SSIPCellID1  | RO   | 0x0000.00F0 | SSI PrimeCell Identification 1  | 955      |

**Table 15-2. SSI Register Map (continued)**

| Offset | Name        | Type | Reset       | Description                    | See page |
|--------|-------------|------|-------------|--------------------------------|----------|
| 0xFF8  | SSIPCellID2 | RO   | 0x0000.0005 | SSI PrimeCell Identification 2 | 956      |
| 0xFFC  | SSIPCellID3 | RO   | 0x0000.00B1 | SSI PrimeCell Identification 3 | 957      |

## 15.6 Register Descriptions

The remainder of this section lists and describes the SSI registers, in numerical order by address offset.

**Register 1: SSI Control 0 (SSICR0), offset 0x000**

The **SSICR0** register contains bit fields that control various functions within the SSI module. Functionality such as protocol mode, clock rate, and data size are configured in this register.

**SSI Control 0 (SSICR0)**

SSI0 base: 0x4000.8000  
 SSI1 base: 0x4000.9000  
 SSI2 base: 0x4000.A000  
 SSI3 base: 0x4000.B000  
 Offset 0x000  
 Type RW, reset 0x0000.0000

|       |          |    |    |    |    |    |    |    |     |     |     |    |     |    |    |    |
|-------|----------|----|----|----|----|----|----|----|-----|-----|-----|----|-----|----|----|----|
|       | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23  | 22  | 21  | 20 | 19  | 18 | 17 | 16 |
|       | reserved |    |    |    |    |    |    |    |     |     |     |    |     |    |    |    |

**Register 3: SSI Data (SSIDR), offset 0x008**

**Important:** This register is read-sensitive. See the register description for details.

The **SSIDR** register is 16-bits wide. When the **SSIDR** register is read, the entry in the receive FIFO that is pointed to by the current FIFO read pointer is accessed. When a data value is removed by the SSI receive logic from the incoming data frame, it is placed into the entry in the receive FIFO pointed to by the current FIFO write pointer.

When the **SSIDR** register is written to, the entry in the transmit FIFO that is pointed to by the write pointer is written to. Data values are removed from the transmit FIFO one value at a time by the transmit logic. Each data value is loaded into the transmit serial shifter, then serially shifted out onto the SSINtx pin at the programmed bit rate.

When a data size of less than 16 bits is selected, the user must right-justify data written to the transmit FIFO. The transmit logic ignores the unused bits. Received data less than 16 bits is automatically right-justified in the receive buffer.

When the SSI is programmed for MICROWIRE frame format, the default size for transmit data is eight bits (the most significant byte is ignored). The receive data size is controlled by the programmer. The transmit FIFO and the receive FIFO are not cleared even when the SSE bit in the **SSICR1** register is cleared, allowing the software to fill the transmit FIFO before enabling the SSI.

|           |      |      |       | Value Description                 |
|           |      |      |       | 0 The transmit FIFO is not empty. |
|           |      |      |       | 1 The transmit FIFO is empty.     |

## Register 5: SSI Clock Prescale (SSICPSR), offset 0x010

The **SSICPSR** register specifies the division factor which is used to derive the SSInClk from the system clock. The clock is further divided by a value from 1 to 256, which is  $1 + \text{SCR}$ . SCR is programmed in the **SSICR0** register. The frequency of the SSInClk is defined by:

$$\text{SSInClk} = \text{SysClk} / (\text{CPSDVSR} * (1 + \text{SCR}))$$

The value programmed into this register must be an even number between 2 and 254. The least-significant bit of the programmed number is hard-coded to zero. If an odd number is written to this register, data read back from this register has the least-significant bit as zero.

**Register 6: SSI Interrupt Mask (SSIIM), offset 0x014**

The **SSIIM** register is the interrupt mask set or clear register. It is a read/write register and all bits are cleared on reset.

On a read, this register gives the current value of the mask on the corresponding interrupt. Setting a bit clears the mask, enabling the interrupt to be sent to the interrupt controller. Clearing a bit sets the corresponding mask, preventing the interrupt from being signaled to the controller.

## 16 Inter-Integrated Circuit (I<sup>2</sup>C) Interface

The Inter-Integrated Circuit (I<sup>2</sup>C) bus provides bi-directional data transfer through a two-wire design (a serial data line SDA and a serial clock line SCL), and interfaces to external I<sup>2</sup>C devices such as serial memory (RAMs and ROMs), networking devices, LCDs, tone generators, and so on. The I<sup>2</sup>C bus may also be used for system testing and diagnostic purposes in product development and manufacturing. The TM4C1231E6PM microcontroller includes providing the ability to communicate (both transmit and receive) with other I<sup>2</sup>C devices on the bus.

The TM4C1231E6PM controller includes I<sup>2</sup>C modules with the following features:

- Devices on the I<sup>2</sup>C bus can be designated as either a master or a slave
  - Supports both transmitting and receiving data as either a master or a slave
  - Supports simultaneous master and slave operation
- Four I<sup>2</sup>C modes
  - Master transmit
  - Master receive
  - Slave transmit
  - Slave receive
- Four transmission speeds:
  - Standard (100 Kbps)
  - Fast-mode (400 Kbps)
  - Fast-mode plus (1 Mbps)
  - High-speed mode (3.33 Mbps)
- Clock low timeout interrupt
- Dual slave address capability
- Glitch suppression
- Master and slave interrupt generation
  - Master generates interrupts when a transmit or receive operation completes (or aborts due to an error)
  - Slave generates interrupts when data has been transferred or requested by a master or when a START or STOP condition is detected
- Master with arbitration and clock synchronization, multimaster support, and 7-bit addressing mode

## 16.1 Block Diagram

Figure 16-1. I<sup>2</sup>C Block Diagram

## 16.2 Signal Description

The following table lists the external signals of the I<sup>2</sup>C interface and describes the function of each. The I<sup>2</sup>C interface signals are alternate functions for some GPIO signals and default to be GPIO signals at reset, with the exception of the I2C0SCL and I2CSDA pins which default to the I<sup>2</sup>C function. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the I<sup>2</sup>C signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 635) should be set to choose the I<sup>2</sup>C function. The number in parentheses is the encoding that must be programmed into the PMCn field in the **GPIO Port Control (GPIOCTL)** register (page 652) to assign the I<sup>2</sup>C signal to the specified GPIO port pin. Note that the I2CSDA pin should be set to open drain using the **GPIO Open Drain Select (GPIOODR)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 613.

Table 16-1. I2C Signals (64LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                      |

| I2C3SCL  | 61         | PD0 (3)                  | I/O      | OD                       | I <sup>2</sup> C module 3 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
| I2C3SDA  | 62         | PD1 (3)                  | I/O      | OD                       | I <sup>2</sup> C module 3 data.                                                                                                                  |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 16.3 Functional Description

Each I<sup>2</sup>C module is comprised of both master and slave functions and is identified by a unique address. A master-initiated communication generates the clock signal, SCL. For proper operation, the SDA pin must be configured as an open-drain signal. Due to the internal circuitry that supports high-speed operation, the SCL pin must not be configured as an open-drain signal, although the internal circuitry causes it to act as if it were an open drain signal. Both SDA and SCL signals must be connected to a positive supply voltage using a pull-up resistor. A typical I<sup>2</sup>C bus configuration is shown in Figure 16-2. Refer to the *I<sup>2</sup>C-bus specification and user manual* to determine the size of the pull-ups needed for proper operation.

See “Inter-Integrated Circuit (I<sup>2</sup>C) Interface” on page 1132 for I<sup>2</sup>C timing diagrams.

**Figure 16-2. I<sup>2</sup>C Bus Configuration**

### 16.3.1 I<sup>2</sup>C Bus Functional Overview

The I<sup>2</sup>C bus uses only two signals: SDA and SCL, named I2CSDA and I2CSCL on TM4C1231E6PM microcontrollers. SDA is the bi-directional serial data line and SCL is the bi-directional serial clock line. The bus is considered idle when both lines are High.

Every transaction on the I<sup>2</sup>C bus is nine bits long, consisting of eight data bits and a single acknowledge bit. The number of bytes per transfer (defined as the time between a valid START and STOP condition, described in “START and STOP Conditions” on page 960) is unrestricted, but each data byte has to be followed by an acknowledge bit, and data must be transferred MSB first. When a receiver cannot receive another complete byte, it can hold the clock line SCL Low and force the transmitter into a wait state. The data transfer continues when the receiver releases the clock SCL.

#### 16.3.1.1 START and STOP Conditions

The protocol of the I<sup>2</sup>C bus defines two states to begin and end a transaction: START and STOP. A High-to-Low transition on the SDA line while the SCL is High is defined as a START condition, and a Low-to-High transition on the SDA line while SCL is High is defined as a STOP condition. The bus is considered busy after a START condition and free after a STOP condition. See Figure 16-3.

**Figure 16-3. START and STOP Conditions**

The STOP bit determines if the cycle stops at the end of the data cycle or continues on to a repeated START condition. To generate a single transmit cycle, the **I<sup>2</sup>C Master Slave Address (I2CMSA)** register is written with the desired address, the R/S bit is cleared, and the Control register is written with ACK=X (0 or 1), STOP=1, START=1, and RUN=1 to perform the operation and stop. When the operation is completed (or aborted due an error), the interrupt pin becomes active and the data may be read from the **I<sup>2</sup>C Master Data (I2CMDR)** register. When the I<sup>2</sup>C module operates in Master receiver mode, the ACK bit is normally set causing the I<sup>2</sup>C bus controller to transmit an acknowledge automatically after each byte. This bit must be cleared when the I<sup>2</sup>C bus controller requires no further data to be transmitted from the slave transmitter.

When operating in slave mode, the STARTRIS and STOPRIS bits in the **I<sup>2</sup>C Slave Raw Interrupt Status (I2CSRIS)** register indicate detection of start and stop conditions on the bus and the **I<sup>2</sup>C Slave Masked Interrupt Status (I2CSMIS)** register can be configured to allow STARTRIS and STOPRIS to be promoted to controller interrupts (when interrupts are enabled).

### 16.3.1.2 Data Format with 7-Bit Address

Data transfers follow the format shown in Figure 16-4. After the START condition, a slave address is transmitted. This address is 7-bits long followed by an eighth bit, which is a data direction bit (R/S bit in the **I2CMSA** register). If the R/S bit is clear, it indicates a transmit operation (send), and if it is set, it indicates a request for data (receive). A data transfer is always terminated by a STOP condition generated by the master, however, a master can initiate communications with another device on the bus by generating a repeated START condition and addressing another slave without first generating a STOP condition. Various combinations of receive/transmit formats are then possible within a single transfer.

**Figure 16-4. Complete Data Transfer with a 7-Bit Address**

The first seven bits of the first byte make up the slave address (see Figure 16-5). The eighth bit determines the direction of the message. A zero in the R/S position of the first byte means that the master transmits (sends) data to the selected slave, and a one in this position means that the master receives data from the slave.

**Figure 16-5. R/S Bit in First Byte**

### 16.3.1.3 Data Validity

The data on the SDA line must be stable during the high period of the clock, and the data line can only change when SCL is Low (see Figure 16-6).

**Figure 16-6. Data Validity During Bit Transfer on the I<sup>2</sup>C Bus**

#### 16.3.1.4 Acknowledge

All bus transactions have a required acknowledge clock cycle that is generated by the master. During the acknowledge cycle, the transmitter (which can be the master or slave) releases the SDA line. To acknowledge the transaction, the receiver must pull down SDA during the acknowledge clock cycle. The data transmitted out by the receiver during the acknowledge cycle must comply with the data validity requirements described in “Data Validity” on page 961.

When a slave receiver does not acknowledge the slave address, SDA must be left High by the slave so that the master can generate a STOP condition and abort the current transfer. If the master device is acting as a receiver during a transfer, it is responsible for acknowledging each transfer made by the slave. Because the master controls the number of bytes in the transfer, it signals the end of data to the slave transmitter by not generating an acknowledge on the last data byte. The slave transmitter must then release SDA to allow the master to generate the STOP or a repeated START condition.

If the slave is required to provide a manual ACK or NACK, the **I<sup>2</sup>C Slave ACK Control (I2CSACKCTL)** register allows the slave to NACK for invalid data or command or ACK for valid data or command. When this operation is enabled, the MCU slave module I<sup>2</sup>C clock is pulled low after the last data bit until this register is written with the indicated response.

#### 16.3.1.5 Repeated Start

The I<sup>2</sup>C master module has the capability of executing a repeated START (transmit or receive) after an initial transfer has occurred.

A repeated start sequence for a Master transmit is as follows:

1. When the device is in the idle state, the Master writes the slave address to the **I2CMSA** register and configures the R/S bit for the desired transfer type.
2. Data is written to the **I2CMDR** register.
3. When the BUSY bit in the **I2CMCS** register is 0, the Master writes 0x3 to the **I2CMCS** register to initiate a transfer.
4. The Master does not generate a STOP condition but instead writes another slave address to the **I2CMSA** register and then writes 0x3 to initiate the repeated START.

A repeated start sequence for a Master receive is similar:

1. When the device is in idle, the Master writes the slave address to the **I2CMSA** register and configures the R/S bit for the desired transfer type.
2. The master reads data from the **I2CMDR** register.

3. When the BUSY bit in the **I2CMCS** register is 0, the Master writes 0x3 to the **I2CMCS** register to initiate a transfer.
4. The Master does not generate a STOP condition but instead writes another slave address to the **I2CMSA** register and then writes 0x3 to initiate the repeated START.

For more information on repeated START, refer to Figure 16-12 on page 973 and Figure 16-13 on page 974.

### 16.3.1.6 Clock Low Timeout (CLTO)

The I<sup>2</sup>C slave can extend the transaction by pulling the clock low periodically to create a slow bit transfer rate. The I<sup>2</sup>C module has a 12-bit programmable counter that is used to track how long the clock has been held low. The upper 8 bits of the count value are software programmable through the **I<sup>2</sup>C Master Clock Low Timeout Count (I2CMCLKOCNT)** register. The lower four bits are not user visible and are 0x0. The CNTL value programmed in the **I2CMCLKOCNT** register has to be greater than 0x01. The application can program the eight most significant bits of the counter to reflect the acceptable cumulative low period in transaction. The count is loaded at the START condition and counts down on each falling edge of the internal bus clock of the Master. Note that the internal bus clock generated for this counter keeps running at the programmed I<sup>2</sup>C speed even if SCL is held low on the bus. Upon reaching terminal count, the master state machine forces ABORT on the bus by issuing a STOP condition at the instance of SCL and SDA release.

As an example, if an I<sup>2</sup>C module was operating at 100 kHz speed, programming the **I2CMCLKOCNT** register to 0xDA would translate to the value 0xDA0 since the lower four bits are set to 0x0. This would translate to a decimal value of 3488 clocks or a cumulative clock low period of 34.88 ms at 100 kHz.

The CLKRIS bit in the **I<sup>2</sup>C Master Raw Interrupt Status (I2CMRIS)** register is set when the clock timeout period is reached, allowing the master to start corrective action to resolve the remote slave state. In addition, the CLKTO bit in the **I<sup>2</sup>C Master Control/Status (I2CMCS)** register is set; this bit is cleared when a STOP condition is sent or during the I<sup>2</sup>C master reset. The status of the raw SDA and SCL signals are readable by software through the SDA and SCL bits in the **I<sup>2</sup>C Master Bus Monitor (I2CMBMON)** register to help determine the state of the remote slave.

In the event of a CLTO condition, application software must choose how it intends to attempt bus recovery. Most applications may attempt to manually toggle the I<sup>2</sup>C pins to force the slave to let go of the clock signal (a common solution is to attempt to force a STOP on the bus). If a CLTO is detected before the end of a burst transfer, and the bus is successfully recovered by the master, the master hardware attempts to finish the pending burst operation. Depending on the state of the slave after bus recovery, the actual behavior on the bus varies. If the slave resumes in a state where it can acknowledge the master (essentially, where it was before the bus hang), it continues where it left off. However, if the slave resumes in a reset state (or if a forced STOP by the master causes the slave to enter the idle state), it may ignore the master's attempt to complete the burst operation and NAK the first data byte that the master sends or requests.

Since the behavior of slaves cannot always be predicted, it is suggested that the application software always write the STOP bit in the **I<sup>2</sup>C Master Configuration (I2CMCR)** register during the CLTO interrupt service routine. This limits the amount of data the master attempts to send or receive upon bus recovery to a single byte, and after the single byte is on the wire, the master issues a STOP. An alternative solution is to have the application software reset the I<sup>2</sup>C peripheral before attempting to manually recover the bus. This solution allows the I<sup>2</sup>C master hardware to be returned to a known good (and idle) state before attempting to recover a stuck bus and prevents any unwanted data from appearing on the wire.

**Note:** The Master Clock Low Timeout counter counts for the entire time SCL is held Low continuously. If SCL is deasserted at any point, the Master Clock Low Timeout Counter is reloaded with the value in the **I2CMCLKOCNT** register and begins counting down from this value.

#### 16.3.1.7 Dual Address

The I<sup>2</sup>C interface supports dual address capability for the slave. The additional programmable address is provided and can be matched if enabled. In legacy mode with dual address disabled, the I<sup>2</sup>C slave provides an ACK on the bus if the address matches the OAR field in the **I2CSOAR** register. In dual address mode, the I<sup>2</sup>C slave provides an ACK on the bus if either the OAR field in the **I2CSOAR** register or the OAR2 field in the **I2CSOAR2** register is matched. The enable for dual address is programmable through the OAR2EN bit in the **I2CSOAR2** register and there is no disable on the legacy address.

The OAR2SEL bit in the **I2CSCSR** register indicates if the address that was ACKed is the alternate address or not. When this bit is clear, it indicates either legacy operation or no address match.

#### 16.3.1.8 Arbitration

A master may start a transfer only if the bus is idle. It's possible for two or more masters to generate a START condition within minimum hold time of the START condition. In these situations, an arbitration scheme takes place on the SDA line, while SCL is High. During arbitration, the first of the competing master devices to place a 1 (High) on SDA, while another master transmits a 0 (Low), switches off its data output stage and retires until the bus is idle again.

Arbitration can take place over several bits. Its first stage is a comparison of address bits, and if both masters are trying to address the same device, arbitration continues on to the comparison of data bits.

#### 16.3.1.9 Glitch Suppression in Multi-Master Configuration

When a multi-master configuration is being used, the GFE bit in the **I<sup>2</sup>C Master Configuration (I2CMCR)** register can be set to enable glitch suppression on the SCL and SDA lines and assure proper signal values. The filter can be programmed to different filter widths using the GFPW bit in the **I<sup>2</sup>C Master Configuration 2 (I2CMCR2)** register. The glitch suppression value is in terms of buffered system clocks. Note that all signals will be delayed internally when glitch suppression is nonzero. For example, if GFPW is set to 0x7, 31 clocks should be added onto the calculation for the expected transaction time.

### 16.3.2 Available Speed Modes

The I<sup>2</sup>C bus can run in Standard mode (100 kbps), Fast mode (400 kbps), Fast mode plus (1 Mbps) or High-Speed mode (3.33 Mbps). The selected mode should match the speed of the other I<sup>2</sup>C devices on the bus.

#### 16.3.2.1 Standard, Fast, and Fast Plus Modes

Standard, Fast, and Fast Plus modes are selected using a value in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register that results in an SCL frequency of 100 kbps for Standard mode, 400 kbps for Fast mode, or 1 Mbps for Fast mode plus.

The I<sup>2</sup>C clock rate is determined by the parameters *CLK\_PRD*, *TIMER\_PRD*, *SCL\_LP*, and *SCL\_HP* where:

*CLK\_PRD* is the system clock period

$SCL\_LP$  is the low phase of SCL (fixed at 6)

$SCL\_HP$  is the high phase of SCL (fixed at 4)

$TIMER\_PRD$  is the programmed value in the **I2CMTPR** register (see page 987). This value is determined by replacing the known variables in the equation below and solving for  $TIMER\_PRD$ .

The I<sup>2</sup>C clock period is calculated as follows:

$$SCL\_PERIOD = 2 \times (1 + TIMER\_PRD) \times (SCL\_LP + SCL\_HP) \times CLK\_PRD$$

For example:

$$CLK\_PRD = 50 \text{ ns}$$

$$TIMER\_PRD = 2$$

$$SCL\_LP=6$$

$$SCL\_HP=4$$

yields a SCL frequency of:

$$1/SCL\_PERIOD = 333 \text{ Khz}$$

Table 16-2 gives examples of the timer periods that should be used to generate Standard, Fast mode, and Fast mode plus SCL frequencies based on various system clock frequencies.

**Table 16-2. Examples of I<sup>2</sup>C Master Timer Period Versus Speed Mode**

| System Clock | Timer Period | Standard Mode | Timer Period | Fast Mode | Timer Period | Fast Mode Plus |
|--------------|--------------|---------------|--------------|-----------|--------------|----------------|
| 4 MHz        | 0x01         | 100 Kbps      | -            | -         | -            | -              |
| 6 MHz        | 0x02         | 100 Kbps      | -            | -         | -            | -              |
| 12.5 MHz     | 0x06         | 89 Kbps       | 0x01         | 312 Kbps  | -            | -              |
| 16.7 MHz     | 0x08         | 93 Kbps       | 0x02         | 278 Kbps  | -            | -              |
| 20 MHz       | 0x09         | 100 Kbps      | 0x02         | 333 Kbps  | -            | -              |
| 25 MHz       | 0x0C         | 96.2 Kbps     | 0x03         | 312 Kbps  | -            | -              |
| 33 MHz       | 0x10         | 97.1 Kbps     | 0x04         | 330 Kbps  | -            | -              |
| 40 MHz       | 0x13         | 100 Kbps      | 0x04         | 400 Kbps  | 0x01         | 1000 Kbps      |
| 50 MHz       | 0x18         | 100 Kbps      | 0x06         | 357 Kbps  | 0x02         | 833 Kbps       |
| 80 MHz       | 0x27         | 100 Kbps      | 0x09         | 400 Kbps  | 0x03         | 1000 Kbps      |

### 16.3.2.2 High-Speed Mode

The TM4C1231E6PM I<sup>2</sup>C peripheral has support for High-speed operation as both a master and slave. High-Speed mode is configured by setting the HS bit in the **I<sup>2</sup>C Master Control/Status (I2CMCS)** register. High-Speed mode transmits data at a high bit rate with a 66.6%/33.3% duty cycle, but communication and arbitration are done at Standard, Fast mode, or Fast-mode plus speed, depending on which is selected by the user. When the HS bit in the **I2CMCS** register is set, current mode pull-ups are enabled.

The clock period can be selected using the equation below, but in this case,  $SCL\_LP=2$  and  $SCL\_HP=1$ .

$$SCL\_PERIOD = 2 \times (1 + TIMER\_PRD) \times (SCL\_LP + SCL\_HP) \times CLK\_PRD$$

So for example:

```

CLK_PRD = 25 ns
TIMER_PRD = 1
SCL_LP=2
SCL_HP=1

```

yields a SCL frequency of:

$$1/T = 3.33 \text{ Mhz}$$

Table 16-3 on page 966 gives examples of timer period and system clock in High-Speed mode. Note that the HS bit in the **I2CMTPR** register needs to be set for the TPR value to be used in High-Speed mode.

**Table 16-3. Examples of I<sup>2</sup>C Master Timer Period in High-Speed Mode**

| System Clock | Timer Period | Transmission Mode |
|--------------|--------------|-------------------|
| 40 MHz       | 0x01         | 3.33 Mbps         |
| 50 MHz       | 0x02         | 2.77 Mbps         |
| 80 MHz       | 0x03         | 3.33 Mbps         |

When operating as a master, the protocol is shown in Figure 16-7. The master is responsible for sending a master code byte in either Standard (100 Kbps) or Fast-mode (400 Kbps) before it begins transferring in High-speed mode. The master code byte must contain data in the form of 0000.1XXX and is used to tell the slave devices to prepare for a High-speed transfer. The master code byte should never be acknowledged by a slave since it is only used to indicate that the upcoming data is going to be transferred at a higher data rate. To send the master code byte, software should place the value of the master code byte into the **I2CMSA** register and write the **I2CMCS** register with a value of 0x13. This places the I<sup>2</sup>C master peripheral in High-speed mode, and all subsequent transfers (until STOP) are carried out at High-speed data rate using the normal **I2CMCS** command bits, without setting the HS bit in the **I2CMCS** register. Again, setting the HS bit in the **I2CMCS** register is only necessary during the master code byte.

When operating as a High-speed slave, there is no additional software required.

**Figure 16-7. High-Speed Data Format**

**Note:** High-Speed mode is 3.4 Mbps, provided correct system clock frequency is set and there is appropriate pull strength on SCL and SDA lines.

### 16.3.3 Interrupts

The I<sup>2</sup>C can generate interrupts when the following conditions are observed:

- Master transaction completed
- Master arbitration lost

- Master transaction error
- Master bus timeout
- Slave transaction received
- Slave transaction requested
- Stop condition on bus detected
- Start condition on bus detected

The I<sup>2</sup>C master and I<sup>2</sup>C slave modules have separate interrupt signals. While both modules can generate interrupts for multiple conditions, only a single interrupt signal is sent to the interrupt controller.

### 16.3.3.1 I<sup>2</sup>C Master Interrupts

The I<sup>2</sup>C master module generates an interrupt when a transaction completes (either transmit or receive), when arbitration is lost, or when an error occurs during a transaction. To enable the I<sup>2</sup>C master interrupt, software must set the IM bit in the **I<sup>2</sup>C Master Interrupt Mask (I2CMIMR)** register. When an interrupt condition is met, software must check the ERROR and ARBLST bits in the **I<sup>2</sup>C Master Control/Status (I2CMCS)** register to verify that an error didn't occur during the last transaction and to ensure that arbitration has not been lost. An error condition is asserted if the last transaction wasn't acknowledged by the slave. If an error is not detected and the master has not lost arbitration, the application can proceed with the transfer. The interrupt is cleared by writing a 1 to the IC bit in the **I<sup>2</sup>C Master Interrupt Clear (I2CMICR)** register.

If the application doesn't require the use of interrupts, the raw interrupt status is always visible via the **I<sup>2</sup>C Master Raw Interrupt Status (I2CMRIS)** register.

### 16.3.3.2 I<sup>2</sup>C Slave Interrupts

The slave module can generate an interrupt when data has been received or requested. This interrupt is enabled by setting the DATAIM bit in the **I<sup>2</sup>C Slave Interrupt Mask (I2CSIMR)** register. Software determines whether the module should write (transmit) or read (receive) data from the **I<sup>2</sup>C Slave Data (I2CSDR)** register, by checking the RREQ and TREQ bits of the **I<sup>2</sup>C Slave Control/Status (I2CSCSR)** register. If the slave module is in receive mode and the first byte of a transfer is received, the FBR bit is set along with the RREQ bit. The interrupt is cleared by setting the DATAIC bit in the **I<sup>2</sup>C Slave Interrupt Clear (I2CSICR)** register.

In addition, the slave module can generate an interrupt when a start and stop condition is detected. These interrupts are enabled by setting the STARTIM and STOPIM bits of the **I<sup>2</sup>C Slave Interrupt Mask (I2CSIMR)** register and cleared by writing a 1 to the STOPIC and STARTIC bits of the **I<sup>2</sup>C Slave Interrupt Clear (I2CSICR)** register.

If the application doesn't require the use of interrupts, the raw interrupt status is always visible via the **I<sup>2</sup>C Slave Raw Interrupt Status (I2CSRIS)** register.

### 16.3.4 Loopback Operation

The I<sup>2</sup>C modules can be placed into an internal loopback mode for diagnostic or debug work by setting the LPBK bit in the **I<sup>2</sup>C Master Configuration (I2CMCR)** register. In loopback mode, the SDA and SCL signals from the master and are tied to the SDA and SCL signals of the slave module to allow internal testing of the device without having to go through I/O.

## **16.3.5 Command Sequence Flow Charts**

This section details the steps required to perform the various I<sup>2</sup>C transfer types in both master and slave mode.

### **16.3.5.1 I<sup>2</sup>C Master Command Sequences**

The figures that follow show the command sequences available for the I<sup>2</sup>C master.

Figure 16-8. Master Single TRANSMIT

Figure 16-14. Standard High Speed Mode Master Transmit

### 16.3.5.2 I<sup>2</sup>C Slave Command Sequences

Figure 16-15 on page 976 presents the command sequence available for the I<sup>2</sup>C slave.

**Figure 16-15. Slave Command Sequence**

## 16.4 Initialization and Configuration

### 16.4.1 Configure the I<sup>2</sup>C Module to Transmit a Single Byte as a Master

The following example shows how to configure the I<sup>2</sup>C module to transmit a single byte as a master. This assumes the system clock is 20 MHz.

1. Enable the I<sup>2</sup>C clock using the **RCGCI2C** register in the System Control module (see page 329).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register in the System Control module (see page 321). To find out which GPIO port to enable, refer to Table 20-5 on page 1090.
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register (see page 635). To determine which GPIOs to configure, see Table 20-4 on page 1086.

4. Enable the I2CSDA pin for open-drain operation. See page 640.
5. Configure the PMCN fields in the **GPIOPCTL** register to assign the I<sup>2</sup>C signals to the appropriate pins. See page 652 and Table 20-5 on page 1090.
6. Initialize the I<sup>2</sup>C Master by writing the **I2CMCR** register with a value of 0x0000.0010.
7. Set the desired SCL clock speed of 100 Kbps by writing the **I2CMTPR** register with the correct value. The value written to the **I2CMTPR** register represents the number of system clock periods in one SCL clock period. The TPR value is determined by the following equation:

$$\begin{aligned} \text{TPR} &= (\text{System Clock} / (2 * (\text{SCL\_LP} + \text{SCL\_HP}) * \text{SCL\_CLK})) - 1; \\ \text{TPR} &= (20\text{MHz} / (2 * (6+4) * 100000)) - 1; \\ \text{TPR} &= 9 \end{aligned}$$

Write the **I2CMTPR** register with the value of 0x0000.0009.

8. Specify the slave address of the master and that the next operation is a Transmit by writing the **I2CMSA** register with a value of 0x0000.0076. This sets the slave address to 0x3B.
9. Place data (byte) to be transmitted in the data register by writing the **I2CMDR** register with the desired data.
10. Initiate a single byte transmit of the data from Master to Slave by writing the **I2CMCS** register with a value of 0x0000.0007 (STOP, START, RUN).
11. Wait until the transmission completes by polling the **I2CMCS** register's BUSBSY bit until it has been cleared.
12. Check the ERROR bit in the **I2CMCS** register to confirm the transmit was acknowledged.

## 16.4.2 Configure the I<sup>2</sup>C Master to High Speed Mode

To configure the I<sup>2</sup>C master to High Speed mode:

1. Enable the I<sup>2</sup>C clock using the **RCGCI2C** register in the System Control module (see page 329).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register in the System Control module (see page 321). To find out which GPIO port to enable, refer to Table 20-5 on page 1090.
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFASEL** register (see page 635). To determine which GPIOs to configure, see Table 20-4 on page 1086.
4. Enable the I2CSDA pin for open-drain operation. See page 640.
5. Configure the PMCN fields in the **GPIOPCTL** register to assign the I<sup>2</sup>C signals to the appropriate pins. See page 652 and Table 20-5 on page 1090.
6. Initialize the I<sup>2</sup>C Master by writing the **I2CMCR** register with a value of 0x0000.0010.
7. Set the desired SCL clock speed of 3.33 Mbps by writing the **I2CMTPR** register with the correct value. The value written to the **I2CMTPR** register represents the number of system clock periods in one SCL clock period. The TPR value is determined by the following equation:

```
TPR = (System Clock / (2 * (SCL_LP + SCL_HP) * SCL_CLK)) - 1;
TPR = (80 MHz / (2 * (2 + 1) * 3330000)) - 1;
TPR = 3
```

Write the **I2CMTPR** register with the value of 0x0000.0003.

8. To send the master code byte, software should place the value of the master code byte into the **I2CMSA** register and write the **I2CMCS** register with a value of 0x13.
9. This places the I2C master peripheral in High-speed mode, and all subsequent transfers (until STOP) are carried out at High-speed data rate using the normal **I2CMCS** command bits, without setting the HS bit in the **I2CMCS** register.
10. The transaction is ended by setting the STOP bit in the **I2CMCS** register.
11. Wait until the transmission completes by polling the **I2CMCS** register's BUSBSY bit until it has been cleared.
12. Check the ERROR bit in the **I2CMCS** register to confirm the transmit was acknowledged.

## 16.5 Register Map

Table 16-4 on page 978 lists the I<sup>2</sup>C registers. All addresses given are relative to the I<sup>2</sup>C base address:

- I<sup>2</sup>C 0: 0x4002.0000
- I<sup>2</sup>C 1: 0x4002.1000
- I<sup>2</sup>C 2: 0x4002.2000
- I<sup>2</sup>C 3: 0x4002.3000

Note that the I<sup>2</sup>C module clock must be enabled before the registers can be programmed (see page 329). There must be a delay of 3 system clocks after the I<sup>2</sup>C module clock is enabled before any I<sup>2</sup>C module registers are accessed.

The hw\_i2c.h file in the TivaWare™ Driver Library uses a base address of 0x800 for the I<sup>2</sup>C slave registers. Be aware when using registers with offsets between 0x800 and 0x818 that TivaWare™ for C Series uses an offset between 0x000 and 0x018 with the slave base address.

**Table 16-4. Inter-Integrated Circuit (I<sup>2</sup>C) Interface Register Map**

| Offset                       | Name    | Type | Reset       | Description                        | See page |
|------------------------------|---------|------|-------------|------------------------------------|----------|

## 16.6 Register Descriptions (I<sup>2</sup>C Master)

The remainder of this section lists and describes the I<sup>2</sup>C master registers, in numerical order by address offset.

**Register 1: I<sup>2</sup>C Master Slave Address (I2CMSA), offset 0x000**

This register consists of eight bits: seven address bits (A6-A0), and a Receive/Send bit, which determines if the next operation is a Receive (High), or Transmit (Low).

**I2C Master Slave Address (I2CMSA)**

I2C 0 base: 0x4002.0000

I2C 1 base: 0x4002.1000

I2C 2 base: 0x4002.2000

I2C 3 base: 0x4002.3000

Offset 0x000

Type RW, reset 0x0000.0000

## Register 2: I<sup>2</sup>C Master Control/Status (I2CMCS), offset 0x004

This register accesses status bits when read and control bits when written. When read, the status register indicates the state of the I<sup>2</sup>C bus controller. When written, the control register configures the I<sup>2</sup>C controller operation.

The START bit generates the START or REPEATED START condition. The STOP bit determines if the cycle stops at the end of the data cycle or continues to the next transfer cycle, which could be a repeated START. To generate a single transmit cycle, the **I<sup>2</sup>C Master Slave Address (I2CMSA)** register is written with the desired address, the R/S bit is cleared, and this register is written with ACK=X (0 or 1), STOP=1, START=1, and RUN=1 to perform the operation and stop. When the operation is completed (or aborted due an error), an interrupt becomes active and the data may be read from the **I2CMDR** register. When the I<sup>2</sup>C module operates in Master receiver mode, the ACK bit is normally set, causing the I<sup>2</sup>C bus controller to transmit an acknowledge automatically after each byte. This bit must be cleared when the I<sup>2</sup>C bus controller requires no further data to be transmitted from the slave transmitter.

a. An X in a table cell indicates the bit can be 0 or 1.

b. In Master Receive mode, a STOP condition should be generated only after a Data Negative Acknowledge executed by the master or an Address Negative Acknowledge executed by the slave.

**Register 3: I<sup>2</sup>C Master Data (I2CMDR), offset 0x008**

**Important:** This register is read-sensitive. See the register description for details.

This register contains the data to be transmitted when in the Master Transmit state and the data received when in the Master Receive state.

**I2C Master Data (I2CMDR)**

**Register 7: I<sup>2</sup>C Master Masked Interrupt Status (I2CMMIS), offset 0x018**

This register specifies whether an interrupt was signaled.

**I2C Master Masked Interrupt Status (I2CMMIS)**

I2C 0 base: 0x4002.0000

I2C 1 base: 0x4002.1000

I2C 2 base: 0x4002.2000

I2C 3 base: 0x4002.3000

Offset 0x018

Type RO, reset 0x0000.0000

## Register 10: I<sup>2</sup>C Master Clock Low Timeout Count (I2CMCLKOCNT), offset 0x024

This register contains the upper 8 bits of a 12-bit counter that can be used to keep the timeout limit for clock stretching by a remote slave. The lower four bits of the counter are not user visible and are always 0x0.

**Note:** The Master Clock Low Timeout counter counts for the entire time SCL is held Low continuously. If SCL is deasserted at any point, the Master Clock Low Timeout Counter is reloaded with the value in the **I2CMCLKOCNT** register and begins counting down from this value.

### I2C Master Clock Low Timeout Count (I2CMCLKOCNT)

| 3:0       | reserved    | RO   | 0     | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                                                                                                                                                                                                                                                                                                                             |       |             |     |        |     |         |     |          |     |          |     |          |     |          |     |           |     |           |

**16.7 Register Descriptions (I<sup>2</sup>C Slave)**

The remainder of this section lists and describes the I<sup>2</sup>C slave registers, in numerical order by address offset.

**Register 13: I<sup>2</sup>C Slave Own Address (I2CSOAR), offset 0x800**

This register consists of seven address bits that identify the TM4C1231E6PM I<sup>2</sup>C device on the I<sup>2</sup>C bus.

**I<sup>2</sup>C Slave Own Address (I2CSOAR)**

I2C 0 base: 0x4002.0000

I2C 1 base: 0x4002.1000

I2C 2 base: 0x4002.2000

I2C 3 base: 0x4002.3000

Offset 0x800

Type RW, reset 0x0000.0000

**Register 14: I<sup>2</sup>C Slave Control/Status (I2CSCSR), offset 0x804**

This register functions as a control register when written, and a status register when read.

|-------|-------------|

|   |                                                |
|---|------------------------------------------------|
| 0 | Disables the I <sup>2</sup> C slave operation. |
|---|------------------------------------------------|

|   |                                               |
|---|-----------------------------------------------|
| 1 | Enables the I <sup>2</sup> C slave operation. |
|---|-----------------------------------------------|

Once this bit has been set, it should not be set again unless it has been cleared by writing a 0 or by a reset, otherwise transfer failures may occur.

**Register 15: I<sup>2</sup>C Slave Data (I2CSDR), offset 0x808**

**Important:** This register is read-sensitive. See the register description for details.

This register contains the data to be transmitted when in the Slave Transmit state, and the data received when in the Slave Receive state.

**I2C Slave Data (I2CSDR)**

**Register 21: I<sup>2</sup>C Slave ACK Control (I2CSACKCTL), offset 0x820**

This register enables the I<sup>2</sup>C slave to NACK for invalid data or command or ACK for valid data or command. The I<sup>2</sup>C clock is pulled low after the last data bit until this register is written.

**I2C Slave ACK Control (I2CSACKCTL)**

| 0 | The interface is set to Standard, Fast or Fast mode plus operation.                                                                                                                  |
| 1 | The interface is set to High-Speed operation. Note that this encoding may only be used if the HS bit in the <b>I2CPP</b> register is set. Otherwise, this encoding is not available. |

## 17 Controller Area Network (CAN) Module

Controller Area Network (CAN) is a multicast, shared serial bus standard for connecting electronic control units (ECUs). CAN was specifically designed to be robust in electromagnetically-noisy environments and can utilize a differential balanced line like RS-485 or a more robust twisted-pair wire. Originally created for automotive purposes, it is also used in many embedded control applications (such as industrial and medical). Bit rates up to 1 Mbps are possible at network lengths less than 40 meters. Decreased bit rates allow longer network distances (for example, 125 Kbps at 500 meters).

The TM4C1231E6PM microcontroller includes one CAN unit with the following features:

- CAN protocol version 2.0 part A/B
- Bit rates up to 1 Mbps
- 32 message objects with individual identifier masks
- Maskable interrupt
- Disable Automatic Retransmission mode for Time-Triggered CAN (TTCAN) applications
- Programmable loopback mode for self-test operation
- Programmable FIFO mode enables storage of multiple message objects
- Gluelessly attaches to an external CAN transceiver through the CANnTX and CANnRX signals

17.1 Block Diagram

Figure 17-1. CAN Controller Block Diagram

17.2 Signal Description

The following table lists the external signals of the CAN controller and describes the function of each. The CAN controller signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the CAN signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 635) should be set to choose the CAN controller function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 652) to assign the CAN signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 613.

**Table 17-1. Controller Area Network Signals (64LQFP)**

| Pin Name | Pin Number     | Pin Mux / Pin Assignment      | Pin Type | Buffer Type <sup>a</sup> | Description            |
|----------|----------------|-------------------------------|----------|--------------------------|------------------------|
| CAN0Rx   | 28<br>58<br>59 | PF0 (3)<br>PB4 (8)<br>PE4 (8) | I        | TTL                      | CAN module 0 receive.  |
| CAN0Tx   | 31<br>57<br>60 | PF3 (3)<br>PB5 (8)<br>PE5 (8) | O        | TTL                      | CAN module 0 transmit. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 17.3 Functional Description

The TM4C1231E6PM CAN controller conforms to the CAN protocol version 2.0 (parts A and B). Message transfers that include data, remote, error, and overload frames with an 11-bit identifier (standard) or a 29-bit identifier (extended) are supported. Transfer rates can be programmed up to 1 Mbps.

The CAN module consists of three major parts:

- CAN protocol controller and message handler
- Message memory
- CAN register interface

A data frame contains data for transmission, whereas a remote frame contains no data and is used to request the transmission of a specific message object. The CAN data/remote frame is constructed as shown in Figure 17-2.

**Figure 17-2. CAN Data/Remote Frame**

The protocol controller transfers and receives the serial data from the CAN bus and passes the data on to the message handler. The message handler then loads this information into the appropriate message object based on the current filtering and identifiers in the message object memory. The message handler is also responsible for generating interrupts based on events on the CAN bus.

The message object memory is a set of 32 identical memory blocks that hold the current configuration, status, and actual data for each message object. These memory blocks are accessed via either of the CAN message object register interfaces.

The message memory is not directly accessible in the TM4C1231E6PM memory map, so the TM4C1231E6PM CAN controller provides an interface to communicate with the message memory via two CAN interface register sets for communicating with the message objects. These two interfaces must be used to read or write to each message object. The two message object interfaces allow parallel access to the CAN controller message objects when multiple objects may have new information that must be processed. In general, one interface is used for transmit data and one for receive data.

### 17.3.1 Initialization

To use the CAN controller, the peripheral clock must be enabled using the **RCGC0** register (see page 425). In addition, the clock to the appropriate GPIO module must be enabled via the **RCGC2** register (see page 431). To find out which GPIO port to enable, refer to Table 20-4 on page 1086. Set the GPIO AFSEL bits for the appropriate pins (see page 635). Configure the PMCN fields in the **GPIOCTL** register to assign the CAN signals to the appropriate pins. See page 652 and Table 20-5 on page 1090.

Software initialization is started by setting the INIT bit in the **CAN Control (CANCTL)** register (with software or by a hardware reset) or by going bus-off, which occurs when the transmitter's error counter exceeds a count of 255. While INIT is set, all message transfers to and from the CAN bus are stopped and the CANnTX signal is held High. Entering the initialization state does not change the configuration of the CAN controller, the message objects, or the error counters. However, some configuration registers are only accessible while in the initialization state.

To initialize the CAN controller, set the **CAN Bit Timing (CANBIT)** register and configure each message object. If a message object is not needed, label it as not valid by clearing the MSGVAL bit in the **CAN IFn Arbitration 2 (CANIFnARB2)** register. Otherwise, the whole message object must be initialized, as the fields of the message object may not have valid information, causing unexpected results. Both the INIT and CCE bits in the **CANCTL** register must be set in order to access the **CANBIT** register and the **CAN Baud Rate Prescaler Extension (CANBRPE)** register to configure the bit timing. To leave the initialization state, the INIT bit must be cleared. Afterwards, the internal Bit Stream Processor (BSP) synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (indicating a bus idle condition) before it takes part in bus activities and starts message transfers. Message object initialization does not require the CAN to be in the initialization state and can be done on the fly. However, message objects should all be configured to particular identifiers or set to not valid before message transfer starts. To change the configuration of a message object during normal operation, clear the MSGVAL bit in the **CANIFnARB2** register to indicate that the message object is not valid during the change. When the configuration is completed, set the MSGVAL bit again to indicate that the message object is once again valid.

### 17.3.2 Operation

Two sets of CAN Interface Registers (**CANIF1x** and **CANIF2x**) are used to access the message objects in the Message RAM. The CAN controller coordinates transfers to and from the Message RAM to and from the registers. The two sets are independent and identical and can be used to

queue transactions. Generally, one interface is used to transmit data and one is used to receive data.

Once the CAN module is initialized and the INIT bit in the **CANCTL** register is cleared, the CAN module synchronizes itself to the CAN bus and starts the message transfer. As each message is received, it goes through the message handler's filtering process, and if it passes through the filter, is stored in the message object specified by the MNUM bit in the **CAN IFn Command Request (CANIFnCRQ)** register. The whole message (including all arbitration bits, data-length code, and eight data bytes) is stored in the message object. If the Identifier Mask (the MSK bits in the **CAN IFn Mask 1** and **CAN IFn Mask 2 (CANIFnMSKn)** registers) is used, the arbitration bits that are masked to "don't care" may be overwritten in the message object.

The CPU may read or write each message at any time via the CAN Interface Registers. The message handler guarantees data consistency in case of concurrent accesses.

The transmission of message objects is under the control of the software that is managing the CAN hardware. Message objects can be used for one-time data transfers or can be permanent message objects used to respond in a more periodic manner. Permanent message objects have all arbitration and control set up, and only the data bytes are updated. At the start of transmission, the appropriate TXRQST bit in the **CAN Transmission Request n (CANTXRQn)** register and the NEWDAT bit in the **CAN New Data n (CANNWDAn)** register are set. If several transmit messages are assigned to the same message object (when the number of message objects is not sufficient), the whole message object has to be configured before the transmission of this message is requested.

The transmission of any number of message objects may be requested at the same time; they are transmitted according to their internal priority, which is based on the message identifier (MNUM) for the message object, with 1 being the highest priority and 32 being the lowest priority. Messages may be updated or set to not valid any time, even when their requested transmission is still pending. The old data is discarded when a message is updated before its pending transmission has started. Depending on the configuration of the message object, the transmission of a message may be requested autonomously by the reception of a remote frame with a matching identifier.

Transmission can be automatically started by the reception of a matching remote frame. To enable this mode, set the RMTEN bit in the **CAN IFn Message Control (CANIFnMCTL)** register. A matching received remote frame causes the TXRQST bit to be set, and the message object automatically transfers its data or generates an interrupt indicating a remote frame was requested. A remote frame can be strictly a single message identifier, or it can be a range of values specified in the message object. The CAN mask registers, **CANIFnMSKn**, configure which groups of frames are identified as remote frame requests. The UMASK bit in the **CANIFnMCTL** register enables the MSK bits in the **CANIFnMSKn** register to filter which frames are identified as a remote frame request. The MXTD bit in the **CANIFnMSK2** register should be set if a remote frame request is expected to be triggered by 29-bit extended identifiers.

### 17.3.3 Transmitting Message Objects

If the internal transmit shift register of the CAN module is ready for loading, and if a data transfer is not occurring between the CAN Interface Registers and message RAM, the valid message object with the highest priority that has a pending transmission request is loaded into the transmit shift register by the message handler and the transmission is started. The message object's NEWDAT bit in the **CANNWDAn** register is cleared. After a successful transmission, and if no new data was written to the message object since the start of the transmission, the TXRQST bit in the **CANTXRQn** register is cleared. If the CAN controller is configured to interrupt on a successful transmission of a message object, (the TXIE bit in the **CAN IFn Message Control (CANIFnMCTL)** register is set), the INTPND bit in the **CANIFnMCTL** register is set after a successful transmission. If the CAN module has lost the arbitration or if an error occurred during the transmission, the message is

re-transmitted as soon as the CAN bus is free again. If, meanwhile, the transmission of a message with higher priority has been requested, the messages are transmitted in the order of their priority.

### 17.3.4 Configuring a Transmit Message Object

The following steps illustrate how to configure a transmit message object.

1. In the **CAN IFn Command Mask (CANIFnCMASK)** register:
  - Set the WRNRD bit to specify a write to the **CANIFnCMASK** register; specify whether to transfer the IDMASK, DIR, and MXTD of the message object into the **CAN IFn** registers using the MASK bit
  - Specify whether to transfer the ID, DIR, XTD, and MSGVAL of the message object into the interface registers using the ARB bit
  - Specify whether to transfer the control bits into the interface registers using the CONTROL bit
  - Specify whether to clear the INTPND bit in the **CANIFnMCTL** register using the CLRINTPND bit
  - Specify whether to clear the NEWDAT bit in the **CANNWDAn** register using the NEWDAT bit
  - Specify which bits to transfer using the DATAA and DATAB bits
2. In the **CANIFnMSK1** register, use the MSK[15:0] bits to specify which of the bits in the 29-bit or 11-bit message identifier are used for acceptance filtering. Note that MSK[15:0] in this register are used for bits [15:0] of the 29-bit message identifier and are not used for an 11-bit identifier. A value of 0x00 enables all messages to pass through the acceptance filtering. Also note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
3. In the **CANIFnMSK2** register, use the MSK[12:0] bits to specify which of the bits in the 29-bit or 11-bit message identifier are used for acceptance filtering. Note that MSK[12:0] are used for bits [28:16] of the 29-bit message identifier; whereas MSK[12:2] are used for bits [10:0] of the 11-bit message identifier. Use the MXTD and MDIR bits to specify whether to use XTD and DIR for acceptance filtering. A value of 0x00 enables all messages to pass through the acceptance filtering. Also note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
4. For a 29-bit identifier, configure ID[15:0] in the **CANIFnARB1** register for bits [15:0] of the message identifier and ID[12:0] in the **CANIFnARB2** register for bits [28:16] of the message identifier. Set the XTD bit to indicate an extended identifier; set the DIR bit to indicate transmit; and set the MSGVAL bit to indicate that the message object is valid.
5. For an 11-bit identifier, disregard the **CANIFnARB1** register and configure ID[12:2] in the **CANIFnARB2** register for bits [10:0] of the message identifier. Clear the XTD bit to indicate a standard identifier; set the DIR bit to indicate transmit; and set the MSGVAL bit to indicate that the message object is valid.
6. In the **CANIFnMCTL** register:

- Optionally set the UMASK bit to enable the mask (MSK, MXTD, and MDIR specified in the **CANIFnMSK1** and **CANIFnMSK2** registers) for acceptance filtering
  - Optionally set the TXIE bit to enable the INTPND bit to be set after a successful transmission
  - Optionally set the RMTEN bit to enable the TXRQST bit to be set on the reception of a matching remote frame allowing automatic transmission
  - Set the EOB bit for a single message object
  - Configure the DLC[3:0] field to specify the size of the data frame. Take care during this configuration not to set the NEWDAT, MSGLST, INTPND or TXRQST bits.
7. Load the data to be transmitted into the **CAN IFn Data (CANIFnDA1, CANIFnDA2, CANIFnDB1, CANIFnDB2)** registers. Byte 0 of the CAN data frame is stored in DATA[7:0] in the **CANIFnDA1** register.
  8. Program the number of the message object to be transmitted in the MNUM field in the **CAN IFn Command Request (CANIFnCRQ)** register.
  9. When everything is properly configured, set the TXRQST bit in the **CANIFnMCTL** register. Once this bit is set, the message object is available to be transmitted, depending on priority and bus availability. Note that setting the RMTEN bit in the **CANIFnMCTL** register can also start message transmission if a matching remote frame has been received.

### 17.3.5 Updating a Transmit Message Object

The CPU may update the data bytes of a Transmit Message Object any time via the CAN Interface Registers and neither the MSGVAL bit in the **CANIFnARB2** register nor the TXRQST bits in the **CANIFnMCTL** register have to be cleared before the update.

Even if only some of the data bytes are to be updated, all four bytes of the corresponding **CANIFnDAn/CANIFnDBn** register have to be valid before the content of that register is transferred to the message object. Either the CPU must write all four bytes into the **CANIFnDAn/CANIFnDBn** register or the message object is transferred to the **CANIFnDAn/CANIFnDBn** register before the CPU writes the new data bytes.

In order to only update the data in a message object, the WRNRD, DATAA and DATAB bits in the **CANIFnMSKn** register are set, followed by writing the updated data into **CANIFnDA1, CANIFnDA2, CANIFnDB1, and CANIFnDB2** registers, and then the number of the message object is written to the MNUM field in the **CAN IFn Command Request (CANIFnCRQ)** register. To begin transmission of the new data as soon as possible, set the TXRQST bit in the **CANIFnMSKn** register.

To prevent the clearing of the TXRQST bit in the **CANIFnMCTL** register at the end of a transmission that may already be in progress while the data is updated, the NEWDAT and TXRQST bits have to be set at the same time in the **CANIFnMCTL** register. When these bits are set at the same time, NEWDAT is cleared as soon as the new transmission has started.

### 17.3.6 Accepting Received Message Objects

When the arbitration and control field (the ID and XTD bits in the **CANIFnARB2** and the RMTEN and DLC[3:0] bits of the **CANIFnMCTL** register) of an incoming message is completely shifted into the CAN controller, the message handling capability of the controller starts scanning the message RAM for a matching valid message object. To scan the message RAM for a matching message object, the controller uses the acceptance filtering programmed through the mask bits in the **CANIFnMSKn** register and enabled using the UMASK bit in the **CANIFnMCTL** register. Each valid

message object, starting with object 1, is compared with the incoming message to locate a matching message object in the message RAM. If a match occurs, the scanning is stopped and the message handler proceeds depending on whether it is a data frame or remote frame that was received.

### 17.3.7 Receiving a Data Frame

The message handler stores the message from the CAN controller receive shift register into the matching message object in the message RAM. The data bytes, all arbitration bits, and the DLC bits are all stored into the corresponding message object. In this manner, the data bytes are connected with the identifier even if arbitration masks are used. The NEWDAT bit of the **CANIFnMCTL** register is set to indicate that new data has been received. The CPU should clear this bit when it reads the message object to indicate to the controller that the message has been received, and the buffer is free to receive more messages. If the CAN controller receives a message and the NEWDAT bit is already set, the MSGLST bit in the **CANIFnMCTL** register is set to indicate that the previous data was lost. If the system requires an interrupt on successful reception of a frame, the RXIE bit of the **CANIFnMCTL** register should be set. In this case, the INTPND bit of the same register is set, causing the **CANINT** register to point to the message object that just received a message. The TXRQST bit of this message object should be cleared to prevent the transmission of a remote frame.

### 17.3.8 Receiving a Remote Frame

A remote frame contains no data, but instead specifies which object should be transmitted. When a remote frame is received, three different configurations of the matching message object have to be considered:

**Table 17-2. Message Object Configurations**

| Configuration in <b>CANIFnMCTL</b>                                                                                                                                                                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>■ DIR = 1 (direction = transmit); programmed in the <b>CANIFnARB2</b> register</li> <li>■ RMTEN = 1 (set the TXRQST bit of the <b>CANIFnMCTL</b> register at reception of the frame to enable transmission)</li> <li>■ UMASK = 1 or 0</li> </ul>                                                                           | At the reception of a matching remote frame, the TXRQST bit of this message object is set. The rest of the message object remains unchanged, and the controller automatically transfers the data in the message object as soon as possible.                                                                                                                                                                                                                                                                                                                                                                                      |
| <ul style="list-style-type: none"> <li>■ DIR = 1 (direction = transmit); programmed in the <b>CANIFnARB2</b> register</li> <li>■ RMTEN = 0 (do not change the TXRQST bit of the <b>CANIFnMCTL</b> register at reception of the frame)</li> <li>■ UMASK = 0 (ignore mask in the <b>CANIFnMSKn</b> register)</li> </ul>                                             | At the reception of a matching remote frame, the TXRQST bit of this message object remains unchanged, and the remote frame is ignored. This remote frame is disabled, the data is not transferred and nothing indicates that the remote frame ever happened.                                                                                                                                                                                                                                                                                                                                                                     |
| <ul style="list-style-type: none"> <li>■ DIR = 1 (direction = transmit); programmed in the <b>CANIFnARB2</b> register</li> <li>■ RMTEN = 0 (do not change the TXRQST bit of the <b>CANIFnMCTL</b> register at reception of the frame)</li> <li>■ UMASK = 1 (use mask (MSK, MXTD, and MDIR in the <b>CANIFnMSKn</b> register) for acceptance filtering)</li> </ul> | At the reception of a matching remote frame, the TXRQST bit of this message object is cleared. The arbitration and control field (ID + XTD + RMTEN + DLC) from the shift register is stored into the message object in the message RAM, and the NEWDAT bit of this message object is set. The data field of the message object remains unchanged; the remote frame is treated similar to a received data frame. This mode is useful for a remote data request from another CAN device for which the TM4C1231E6PM controller does not have readily available data. The software must fill the data and answer the frame manually. |

### 17.3.9 Receive/Transmit Priority

The receive/transmit priority for the message objects is controlled by the message number. Message object 1 has the highest priority, while message object 32 has the lowest priority. If more than one transmission request is pending, the message objects are transmitted in order based on the message object with the lowest message number. This prioritization is separate from that of the message identifier which is enforced by the CAN bus. As a result, if message object 1 and message object 2 both have valid messages to be transmitted, message object 1 is always transmitted first regardless of the message identifier in the message object itself.

#### 17.3.10 Configuring a Receive Message Object

The following steps illustrate how to configure a receive message object.

1. Program the **CAN IFn Command Mask (CANIFnCMASK)** register as described in the “Configuring a Transmit Message Object” on page 1014 section, except that the WRNRD bit is set to specify a write to the message RAM.
2. Program the **CANIFnMSK1** and **CANIFnMSK2** registers as described in the “Configuring a Transmit Message Object” on page 1014 section to configure which bits are used for acceptance filtering. Note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
3. In the **CANIFnMSK2** register, use the MSK[12:0] bits to specify which of the bits in the 29-bit or 11-bit message identifier are used for acceptance filtering. Note that MSK[12:0] are used for bits [28:16] of the 29-bit message identifier; whereas MSK[12:2] are used for bits [10:0] of the 11-bit message identifier. Use the MXTD and MDIR bits to specify whether to use XTD and DIR for acceptance filtering. A value of 0x00 enables all messages to pass through the acceptance filtering. Also note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
4. Program the **CANIFnARB1** and **CANIFnARB2** registers as described in the “Configuring a Transmit Message Object” on page 1014 section to program XTD and ID bits for the message identifier to be received; set the MSGVAL bit to indicate a valid message; and clear the DIR bit to specify receive.
5. In the **CANIFnMCTL** register:
  - Optionally set the UMASK bit to enable the mask (MSK, MXTD, and MDIR specified in the **CANIFnMSK1** and **CANIFnMSK2** registers) for acceptance filtering
  - Optionally set the RXIE bit to enable the INTPND bit to be set after a successful reception
  - Clear the RMTEN bit to leave the TXRQST bit unchanged
  - Set the EOB bit for a single message object
  - Configure the DLC[3:0] field to specify the size of the data frame

Take care during this configuration not to set the NEWDAT, MSGLST, INTPND or TXRQST bits.
6. Program the number of the message object to be received in the MNUM field in the **CAN IFn Command Request (CANIFnCRQ)** register. Reception of the message object begins as soon as a matching frame is available on the CAN bus.

When the message handler stores a data frame in the message object, it stores the received Data Length Code and eight data bytes in the **CANIFnDA1**, **CANIFnDA2**, **CANIFnDB1**, and **CANIFnDB2** register. Byte 0 of the CAN data frame is stored in DATA[7:0] in the **CANIFnDA1** register. If the Data Length Code is less than 8, the remaining bytes of the message object are overwritten by unspecified values.

The CAN mask registers can be used to allow groups of data frames to be received by a message object. The CAN mask registers, **CANIFnMSKn**, configure which groups of frames are received by a message object. The UMASK bit in the **CANIFnMCTL** register enables the MSK bits in the **CANIFnMSKn** register to filter which frames are received. The MXTD bit in the **CANIFnMSK2** register should be set if only 29-bit extended identifiers are expected by this message object.

### 17.3.11 Handling of Received Message Objects

The CPU may read a received message any time via the CAN Interface registers because the data consistency is guaranteed by the message handler state machine.

Typically, the CPU first writes 0x007F to the **CANIFnCMSK** register and then writes the number of the message object to the **CANIFnCRQ** register. That combination transfers the whole received message from the message RAM into the Message Buffer registers (**CANIFnMSKn**, **CANIFnARBn**, and **CANIFnMCTL**). Additionally, the NEWDAT and INTPND bits are cleared in the message RAM, acknowledging that the message has been read and clearing the pending interrupt generated by this message object.

If the message object uses masks for acceptance filtering, the **CANIFnARBn** registers show the full, unmasked ID for the received message.

The NEWDAT bit in the **CANIFnMCTL** register shows whether a new message has been received since the last time this message object was read. The MSGLST bit in the **CANIFnMCTL** register shows whether more than one message has been received since the last time this message object was read. MSGLST is not automatically cleared, and should be cleared by software after reading its status.

Using a remote frame, the CPU may request new data from another CAN node on the CAN bus. Setting the TXRQST bit of a receive object causes the transmission of a remote frame with the receive object's identifier. This remote frame triggers the other CAN node to start the transmission of the matching data frame. If the matching data frame is received before the remote frame could be transmitted, the TXRQST bit is automatically reset. This prevents the possible loss of data when the other device on the CAN bus has already transmitted the data slightly earlier than expected.

#### 17.3.11.1 Configuration of a FIFO Buffer

With the exception of the EOB bit in the **CANIFnMCTL** register, the configuration of receive message objects belonging to a FIFO buffer is the same as the configuration of a single receive message object (see "Configuring a Receive Message Object" on page 1017). To concatenate two or more message objects into a FIFO buffer, the identifiers and masks (if used) of these message objects have to be programmed to matching values. Due to the implicit priority of the message objects, the message object with the lowest message object number is the first message object in a FIFO buffer. The EOB bit of all message objects of a FIFO buffer except the last one must be cleared. The EOB bit of the last message object of a FIFO buffer is set, indicating it is the last entry in the buffer.

#### 17.3.11.2 Reception of Messages with FIFO Buffers

Received messages with identifiers matching to a FIFO buffer are stored starting with the message object with the lowest message number. When a message is stored into a message object of a FIFO buffer, the NEWDAT of the **CANIFnMCTL** register bit of this message object is set. By setting

NEWDAT while EOB is clear, the message object is locked and cannot be written to by the message handler until the CPU has cleared the NEWDAT bit. Messages are stored into a FIFO buffer until the last message object of this FIFO buffer is reached. Until all of the preceding message objects have been released by clearing the NEWDAT bit, all further messages for this FIFO buffer are written into the last message object of the FIFO buffer and therefore overwrite previous messages.

#### 17.3.11.3 Reading from a FIFO Buffer

When the CPU transfers the contents of a message object from a FIFO buffer by writing its number to the **CANIFnCRQ** register, the TXRQST and CLRINTPND bits in the **CANIFnCMSK** register should be set such that the NEWDAT and INTPEND bits in the **CANIFnMCTL** register are cleared after the read. The values of these bits in the **CANIFnMCTL** register always reflect the status of the message object before the bits are cleared. To assure the correct function of a FIFO buffer, the CPU should read out the message objects starting with the message object with the lowest message number. When reading from the FIFO buffer, the user should be aware that a new received message is placed in the message object with the lowest message number for which the NEWDAT bit of the **CANIFnMCTL** register is clear. As a result, the order of the received messages in the FIFO is not guaranteed. Figure 17-3 on page 1020 shows how a set of message objects which are concatenated to a FIFO Buffer can be handled by the CPU.

Figure 17-3. Message Objects in a FIFO Buffer

### 17.3.12 Handling of Interrupts

If several interrupts are pending, the **CAN Interrupt (CANINT)** register points to the pending interrupt with the highest priority, disregarding their chronological order. The status interrupt has the highest

priority. Among the message interrupts, the message object's interrupt with the lowest message number has the highest priority. A message interrupt is cleared by clearing the message object's INTPND bit in the **CANIFnMCTL** register or by reading the **CAN Status (CANSTS)** register. The status Interrupt is cleared by reading the **CANSTS** register.

The interrupt identifier INTID in the **CANINT** register indicates the cause of the interrupt. When no interrupt is pending, the register reads as 0x0000. If the value of the INTID field is different from 0, then an interrupt is pending. If the IE bit is set in the **CANCTL** register, the interrupt line to the interrupt controller is active. The interrupt line remains active until the INTID field is 0, meaning that all interrupt sources have been cleared (the cause of the interrupt is reset), or until IE is cleared, which disables interrupts from the CAN controller.

The INTID field of the **CANINT** register points to the pending message interrupt with the highest interrupt priority. The SIE bit in the **CANCTL** register controls whether a change of the RXOK, TXOK, and LEC bits in the **CANSTS** register can cause an interrupt. The EIE bit in the **CANCTL** register controls whether a change of the BOFF and EWARN bits in the **CANSTS** register can cause an interrupt. The IE bit in the **CANCTL** register controls whether any interrupt from the CAN controller actually generates an interrupt to the interrupt controller. The **CANINT** register is updated even when the IE bit in the **CANCTL** register is clear, but the interrupt is not indicated to the CPU.

A value of 0x8000 in the **CANINT** register indicates that an interrupt is pending because the CAN module has updated, but not necessarily changed, the **CANSTS** register, indicating that either an error or status interrupt has been generated. A write access to the **CANSTS** register can clear the RXOK, TXOK, and LEC bits in that same register; however, the only way to clear the source of a status interrupt is to read the **CANSTS** register.

The source of an interrupt can be determined in two ways during interrupt handling. The first is to read the INTID bit in the **CANINT** register to determine the highest priority interrupt that is pending, and the second is to read the **CAN Message Interrupt Pending (CANMSGnINT)** register to see all of the message objects that have pending interrupts.

An interrupt service routine reading the message that is the source of the interrupt may read the message and clear the message object's INTPND bit at the same time by setting the CLRINTPND bit in the **CANIFnCMSK** register. Once the INTPND bit has been cleared, the **CANINT** register contains the message number for the next message object with a pending interrupt.

### 17.3.13 Test Mode

A Test Mode is provided which allows various diagnostics to be performed. Test Mode is entered by setting the TEST bit in the **CANCTL** register. Once in Test Mode, the TX[1:0], LBACK, SILENT and BASIC bits in the **CAN Test (CANTST)** register can be used to put the CAN controller into the various diagnostic modes. The RX bit in the **CANTST** register allows monitoring of the CANnRX signal. All **CANTST** register functions are disabled when the TEST bit is cleared.

#### 17.3.13.1 Silent Mode

Silent Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits (Acknowledge Bits, Error Frames). The CAN Controller is put in Silent Mode setting the SILENT bit in the **CANTST** register. In Silent Mode, the CAN controller is able to receive valid data frames and valid remote frames, but it sends only recessive bits on the CAN bus and cannot start a transmission. If the CAN Controller is required to send a dominant bit (ACK bit, overload flag, or active error flag), the bit is rerouted internally so that the CAN Controller monitors this dominant bit, although the CAN bus remains in recessive state.

### 17.3.13.2 Loopback Mode

Loopback mode is useful for self-test functions. In Loopback Mode, the CAN Controller internally routes the CANnTX signal on to the CANnRX signal and treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into the message buffer. The CAN Controller is put in Loopback Mode by setting the LBACK bit in the **CANTST** register. To be independent from external stimulation, the CAN Controller ignores acknowledge errors (a recessive bit sampled in the acknowledge slot of a data/remote frame) in Loopback Mode. The actual value of the CANnRX signal is disregarded by the CAN Controller. The transmitted messages can be monitored on the CANnTX signal.

### 17.3.13.3 Loopback Combined with Silent Mode

Loopback Mode and Silent Mode can be combined to allow the CAN Controller to be tested without affecting a running CAN system connected to the CANnTX and CANnRX signals. In this mode, the CANnRX signal is disconnected from the CAN Controller and the CANnTX signal is held recessive. This mode is enabled by setting both the LBACK and SILENT bits in the **CANTST** register.

### 17.3.13.4 Basic Mode

Basic Mode allows the CAN Controller to be operated without the Message RAM. In Basic Mode, The CANIF1 registers are used as the transmit buffer. The transmission of the contents of the IF1 registers is requested by setting the BUSY bit of the **CANIF1CRQ** register. The CANIF1 registers are locked while the BUSY bit is set. The BUSY bit indicates that a transmission is pending. As soon the CAN bus is idle, the CANIF1 registers are loaded into the shift register of the CAN Controller and transmission is started. When the transmission has completed, the BUSY bit is cleared and the locked CANIF1 registers are released. A pending transmission can be aborted at any time by clearing the BUSY bit in the **CANIF1CRQ** register while the CANIF1 registers are locked. If the CPU has cleared the BUSY bit, a possible retransmission in case of lost arbitration or an error is disabled.

The CANIF2 Registers are used as a receive buffer. After the reception of a message, the contents of the shift register are stored in the CANIF2 registers, without any acceptance filtering. Additionally, the actual contents of the shift register can be monitored during the message transfer. Each time a read message object is initiated by setting the BUSY bit of the **CANIF2CRQ** register, the contents of the shift register are stored into the CANIF2 registers.

In Basic Mode, all message-object-related control and status bits and of the control bits of the **CANIFnCMSK** registers are not evaluated. The message number of the **CANIFnCRQ** registers is also not evaluated. In the **CANIF2MCTL** register, the NEWDAT and MSGLSST bits retain their function, the DLC[3:0] field shows the received DLC, the other control bits are cleared.

Basic Mode is enabled by setting the BASIC bit in the **CANTST** register.

### 17.3.13.5 Transmit Control

Software can directly override control of the CANnTX signal in four different ways.

- CANnTX is controlled by the CAN Controller
- The sample point is driven on the CANnTX signal to monitor the bit timing
- CANnTX drives a low value
- CANnTX drives a high value

The last two functions, combined with the readable CAN receive pin CANnRX, can be used to check the physical layer of the CAN bus.

The Transmit Control function is enabled by programming the TX[1:0] field in the **CANTST** register. The three test functions for the CANnTX signal interfere with all CAN protocol functions. TX[1:0] must be cleared when CAN message transfer or Loopback Mode, Silent Mode, or Basic Mode are selected.

### 17.3.14 Bit Timing Configuration Error Considerations

Even if minor errors in the configuration of the CAN bit timing do not result in immediate failure, the performance of a CAN network can be reduced significantly. In many cases, the CAN bit synchronization amends a faulty configuration of the CAN bit timing to such a degree that only occasionally an error frame is generated. In the case of arbitration, however, when two or more CAN nodes simultaneously try to transmit a frame, a misplaced sample point may cause one of the transmitters to become error passive. The analysis of such sporadic errors requires a detailed knowledge of the CAN bit synchronization inside a CAN node and of the CAN nodes' interaction on the CAN bus.

### 17.3.15 Bit Time and Bit Rate

The CAN system supports bit rates in the range of lower than 1 Kbps up to 1000 Kbps. Each member of the CAN network has its own clock generator. The timing parameter of the bit time can be configured individually for each CAN node, creating a common bit rate even though the CAN nodes' oscillator periods may be different.

Because of small variations in frequency caused by changes in temperature or voltage and by deteriorating components, these oscillators are not absolutely stable. As long as the variations remain inside a specific oscillator's tolerance range, the CAN nodes are able to compensate for the different bit rates by periodically resynchronizing to the bit stream.

According to the CAN specification, the bit time is divided into four segments (see Figure 17-4 on page 1024): the Synchronization Segment, the Propagation Time Segment, the Phase Buffer Segment 1, and the Phase Buffer Segment 2. Each segment consists of a specific, programmable number of time quanta (see Table 17-3 on page 1024). The length of the time quantum ( $t_q$ ), which is the basic time unit of the bit time, is defined by the CAN controller's input clock ( $f_{sys}$ ) and the Baud Rate Prescaler (BRP):

$$t_q = \text{BRP} / f_{sys}$$

The  $f_{sys}$  input clock is the system clock frequency as configured by the **RCC** or **RCC2** registers (see page 241 or page 247).

The Synchronization Segment Sync is that part of the bit time where edges of the CAN bus level are expected to occur; the distance between an edge that occurs outside of Sync and the Sync is called the phase error of that edge.

The Propagation Time Segment Prop is intended to compensate for the physical delay times within the CAN network.

The Phase Buffer Segments Phase1 and Phase2 surround the Sample Point.

The (Re-)Synchronization Jump Width (SJW) defines how far a resynchronization may move the Sample Point inside the limits defined by the Phase Buffer Segments to compensate for edge phase errors.

A given bit rate may be met by different bit-time configurations, but for the proper function of the CAN network, the physical delay times and the oscillator's tolerance range have to be considered.

Figure 17-4. CAN Bit Time

Table 17-3. CAN Protocol Ranges<sup>a</sup>

| Parameter | Range                   | Remark                                                                                                                       |
|-----------|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| BRP       | [1 .. 64]               | Defines the length of the time quantum t <sub>q</sub> . The <b>CANBRPE</b> register can be used to extend the range to 1024. |
| Sync      | 1 t <sub>q</sub>        | Fixed length, synchronization of bus input to system clock                                                                   |
| Prop      | [1 .. 8] t <sub>q</sub> | Compensates for the physical delay times                                                                                     |
| Phase1    | [1 .. 8] t <sub>q</sub> | May be lengthened temporarily by synchronization                                                                             |
| Phase2    | [1 .. 8] t <sub>q</sub> | May be shortened temporarily by synchronization                                                                              |
| SJW       | [1 .. 4] t <sub>q</sub> | May not be longer than either Phase Buffer Segment                                                                           |

a. This table describes the minimum programmable ranges required by the CAN protocol.

The bit timing configuration is programmed in two register bytes in the **CANBIT** register. In the **CANBIT** register, the four components TSEG2, TSEG1, SJW, and BRP have to be programmed to a numerical value that is one less than its functional value; so instead of values in the range of [1..n], values in the range of [0..n-1] are programmed. That way, for example, SJW (functional range of [1..4]) is represented by only two bits in the SJW bit field. Table 17-4 shows the relationship between the **CANBIT** register values and the parameters.

Table 17-4. CANBIT Register Values

| CANBIT Register Field | Setting           |
|-----------------------|-------------------|
| TSEG2                 | Phase2 - 1        |
| TSEG1                 | Prop + Phase1 - 1 |
| SJW                   | SJW - 1           |
| BRP                   | BRP               |

Therefore, the length of the bit time is (programmed values):

$$[TSEG1 + TSEG2 + 3] \times t_q$$

or (functional values):

$$[Sync + Prop + Phase1 + Phase2] \times t_q$$

The data in the **CANBIT** register is the configuration input of the CAN protocol controller. The baud rate prescaler (configured by the BRP field) defines the length of the time quantum, the basic time

unit of the bit time; the bit timing logic (configured by TSEG1, TSEG2, and SJW) defines the number of time quanta in the bit time.

The processing of the bit time, the calculation of the position of the sample point, and occasional synchronizations are controlled by the CAN controller and are evaluated once per time quantum.

The CAN controller translates messages to and from frames. In addition, the controller generates and discards the enclosing fixed format bits, inserts and extracts stuff bits, calculates and checks the CRC code, performs the error management, and decides which type of synchronization is to be used. The bit value is received or transmitted at the sample point. The information processing time (IPT) is the time after the sample point needed to calculate the next bit to be transmitted on the CAN bus. The IPT includes any of the following: retrieving the next data bit, handling a CRC bit, determining if bit stuffing is required, generating an error flag or simply going idle.

The IPT is application-specific but may not be longer than  $2 t_q$ ; the CAN's IPT is  $0 t_q$ . Its length is the lower limit of the programmed length of Phase2. In case of synchronization, Phase2 may be shortened to a value less than IPT, which does not affect bus timing.

### 17.3.16 Calculating the Bit Timing Parameters

Usually, the calculation of the bit timing configuration starts with a required bit rate or bit time. The resulting bit time (1/bit rate) must be an integer multiple of the system clock period.

The bit time may consist of 4 to 25 time quanta. Several combinations may lead to the required bit time, allowing iterations of the following steps.

The first part of the bit time to be defined is Prop. Its length depends on the delay times measured in the system. A maximum bus length as well as a maximum node delay has to be defined for expandable CAN bus systems. The resulting time for Prop is converted into time quanta (rounded up to the nearest integer multiple of  $t_q$ ).

Sync is  $1 t_q$  long (fixed), which leaves  $(\text{bit time} - \text{Prop} - 1) t_q$  for the two Phase Buffer Segments. If the number of remaining  $t_q$  is even, the Phase Buffer Segments have the same length, that is,  $\text{Phase2} = \text{Phase1}$ , else  $\text{Phase2} = \text{Phase1} + 1$ .

The minimum nominal length of Phase2 has to be regarded as well. Phase2 may not be shorter than the CAN controller's Information Processing Time, which is, depending on the actual implementation, in the range of  $[0..2] t_q$ .

The length of the synchronization jump width is set to the least of 4, Phase1 or Phase2.

The oscillator tolerance range necessary for the resulting configuration is calculated by the formula given below:

$$(1 - df) \times f_{nom} \leq f_{osc} \leq (1 + df) \times f_{nom}$$

where:

- $df$  = Maximum tolerance of oscillator frequency
- $f_{osc}$  = Actual oscillator frequency
- $f_{nom}$  = Nominal oscillator frequency

Maximum frequency tolerance must take into account the following formulas:

$$df \leq \frac{(Phase\_seg1, Phase\_seg2) \min}{2 \times (13 \times tbit - Phase\_Seg2)}$$

$$df \max = 2 \times df \times fnom$$

where:

- Phase1 and Phase2 are from Table 17-3 on page 1024
- tbit = Bit Time
- dfmax = Maximum difference between two oscillators

If more than one configuration is possible, that configuration allowing the highest oscillator tolerance range should be chosen.

CAN nodes with different system clocks require different configurations to come to the same bit rate. The calculation of the propagation time in the CAN network, based on the nodes with the longest delay times, is done once for the whole network.

The CAN system's oscillator tolerance range is limited by the node with the lowest tolerance range.

The calculation may show that bus length or bit rate have to be decreased or that the oscillator frequencies' stability has to be increased in order to find a protocol-compliant configuration of the CAN bit timing.

### 17.3.16.1 Example for Bit Timing at High Baud Rate

In this example, the frequency of CAN clock is 25 MHz, and the bit rate is 1 Mbps.

$$\text{bit time} = 1 \mu\text{s} = n * t_q = 5 * t_q$$

$$t_q = 200 \text{ ns}$$

$$t_q = (\text{Baud rate Prescaler}) / \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = t_q * \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = 200\text{E}-9 * 25\text{E}6 = 5$$

$$t_{\text{Sync}} = 1 * t_q = 200 \text{ ns}$$

\\fixed at 1 time quanta

delay of bus driver 50 ns

delay of receiver circuit 30 ns

delay of bus line (40m) 220 ns

$$t_{\text{Prop}} 400 \text{ ns} = 2 * t_q$$

\\400 is next integer multiple of  $t_q$

$$\text{bit time} = t_{\text{Sync}} + t_{\text{Tseg1}} + t_{\text{Tseg2}} = 5 * t_q$$

$$\text{bit time} = t_{\text{Sync}} + t_{\text{Prop}} + t_{\text{Phase 1}} + t_{\text{Phase 2}}$$

$$t_{\text{Phase 1}} + t_{\text{Phase 2}} = \text{bit time} - t_{\text{Sync}} - t_{\text{Prop}}$$

$$t_{\text{Phase 1}} + t_{\text{Phase 2}} = (5 * t_q) - (1 * t_q) - (2 * t_q)$$

$$t_{\text{Phase 1}} + t_{\text{Phase 2}} = 2 * t_q$$

$$t_{\text{Phase1}} = 1 * t_q$$

$$t_{\text{Phase2}} = 1 * t_q$$

\\tPhase2 = tPhase1

$$tTSeg1 = tProp + tPhase1$$

$$tTSeg1 = (2 * t_q) + (1 * t_q)$$

$$tTSeg1 = 3 * t_q$$

$$tTSeg2 = tPhase2$$

$$tTSeg2 = (\text{Information Processing Time} + 1) * t_q$$

$$tTSeg2 = 1 * t_q \quad \backslash\backslash \text{Assumes IPT}=0$$

$$tSJW = 1 * t_q \quad \backslash\backslash \text{Least of 4, Phase1 and Phase2}$$

In the above example, the bit field values for the **CANBIT** register are:

|       |                                           |
|-------|-------------------------------------------|
| TSEG2 | = TSeg2 -1<br>= 1-1<br>= 0                |
| TSEG1 | = TSeg1 -1<br>= 3-1<br>= 2                |
| SJW   | = SJW -1<br>= 1-1<br>= 0                  |
| BRP   | = Baud rate prescaler - 1<br>= 5-1<br>= 4 |

The final value programmed into the **CANBIT** register = 0x0204.

### 17.3.16.2 Example for Bit Timing at Low Baud Rate

In this example, the frequency of the CAN clock is 50 MHz, and the bit rate is 100 Kbps.

$$\text{bit time} = 10 \mu\text{s} = n * t_q = 10 * t_q$$

$$t_q = 1 \mu\text{s}$$

$$t_q = (\text{Baud rate Prescaler}) / \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = t_q * \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = 1\text{E-}6 * 50\text{E}6 = 50$$

$$tSync = 1 * t_q = 1 \mu\text{s} \quad \backslash\backslash \text{fixed at 1 time quanta}$$

$$\text{delay of bus driver } 200 \text{ ns}$$

$$\text{delay of receiver circuit } 80 \text{ ns}$$

$$\text{delay of bus line (40m) } 220 \text{ ns}$$

$$tProp 1 \mu\text{s} = 1 * t_q \quad \backslash\backslash 1 \mu\text{s is next integer multiple of } t_q$$

$$\text{bit time} = tSync + tTSeg1 + tTSeg2 = 10 * t_q$$

$$\text{bit time} = tSync + tProp + tPhase 1 + tPhase2$$

$$tPhase 1 + tPhase2 = \text{bit time} - tSync - tProp$$

$$tPhase 1 + tPhase2 = (10 * t_q) - (1 * t_q) - (1 * t_q)$$

$$tPhase 1 + tPhase2 = 8 * t_q$$

$$tPhase1 = 4 * t_q$$

$$tPhase2 = 4 * t_q \quad \backslash\backslash tPhase1 = tPhase2$$

$$\begin{aligned}
 tTSeg1 &= tProp + tPhase1 \\
 tTSeg1 &= (1 * t_q) + (4 * t_q) \\

The final value programmed into the **CANBIT** register = 0x34F1.

## 17.4 Register Map

Table 17-5 on page 1028 lists the registers. All addresses given are relative to the CAN base address of:

■ CAN0: 0x4004.0000

Note that the CAN controller clock must be enabled before the registers can be programmed (see page 331). There must be a delay of 3 system clocks after the CAN module clock is enabled before any CAN module registers are accessed.

**Table 17-5. CAN Register Map**

## 17.5 CAN Register Descriptions

The remainder of this section lists and describes the CAN registers, in numerical order by address offset. There are two sets of Interface Registers that are used to access the Message Objects in the Message RAM: **CANIF1x** and **CANIF2x**. The function of the two sets are identical and are used to queue transactions.

**Register 1: CAN Control (CANCTL), offset 0x000**

This control register initializes the module and enables test mode and interrupts.

The bus-off recovery sequence (see CAN Specification Rev. 2.0) cannot be shortened by setting or clearing INIT. If the device goes bus-off, it sets INIT, stopping all bus activities. Once INIT has been cleared by the CPU, the device then waits for 129 occurrences of Bus Idle (129 \* 11 consecutive High bits) before resuming normal operations. At the end of the bus-off recovery sequence, the Error Management Counters are reset.

During the waiting time after INIT is cleared, each time a sequence of 11 High bits has been monitored, a BITERROR0 code is written to the **CANSTS** register (the LEC field = 0x5), enabling the CPU to readily check whether the CAN bus is stuck Low or continuously disturbed, and to monitor the proceeding of the bus-off recovery sequence.

**CAN Control (CANCTL)**

**Register 2: CAN Status (CANSTS), offset 0x004**

**Important:** This register is read-sensitive. See the register description for details.

The status register contains information for interrupt servicing such as Bus-Off, error count threshold, and error types.

The LEC field holds the code that indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error. The unused error code 0x7 may be written by the CPU to manually set this field to an invalid error so that it can be checked for a change later.

An error interrupt is generated by the BOFF and EWARN bits, and a status interrupt is generated by the RXOK, TXOK, and LEC bits, if the corresponding enable bits in the **CAN Control (CANCTL)** register are set. A change of the EPASS bit or a write to the RXOK, TXOK, or LEC bits does not generate an interrupt.

Reading the **CAN Status (CANSTS)** register clears the **CAN Interrupt (CANINT)** register, if it is pending.

**CAN Status (CANSTS)**

CAN0 base: 0x4004.0000

Offset 0x004

Type RW, reset 0x0000.0000

When the arbitration field is transmitted, data conflicts are a part of the arbitration protocol. When other frame fields are transmitted, data conflicts are considered errors. |  | A Bit 1 Error indicates that the device wanted to send a High level (logical 1) but the monitored bus value was Low (logical 0). | 0x5 | Bit 0 Error |  | A Bit 0 Error indicates that the device wanted to send a Low level (logical 0), but the monitored bus value was High (logical 1). |  | During bus-off recovery, this status is set each time a sequence of 11 High bits has been monitored. By checking for this status, software can monitor the proceeding of the bus-off recovery sequence without any disturbances to the bus. | 0x6 | CRC Error |  | The CRC checksum was incorrect in the received message, indicating that the calculated value received did not match the calculated CRC of the data. | 0x7 | No Event |  | When the LEC bit shows this value, no CAN bus event was detected since this value was written to the LEC field. |
| Value     | Description                                                                                                                                                                                                                                                                         |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

|           | When a message is transmitted, the CAN controller monitors the data lines to detect any conflicts. When the arbitration field is transmitted, data conflicts are a part of the arbitration protocol. When other frame fields are transmitted, data conflicts are considered errors. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |
|           | A Bit 1 Error indicates that the device wanted to send a High level (logical 1) but the monitored bus value was Low (logical 0).                                                                                                                                                    |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

|           | A Bit 0 Error indicates that the device wanted to send a Low level (logical 0), but the monitored bus value was High (logical 1).                                                                                                                                                   |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |
|           | During bus-off recovery, this status is set each time a sequence of 11 High bits has been monitored. By checking for this status, software can monitor the proceeding of the bus-off recovery sequence without any disturbances to the bus.                                         |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

**Register 3: CAN Error Counter (CANERR), offset 0x008**

This register contains the error counter values, which can be used to analyze the cause of an error.

**CAN Error Counter (CANERR)**

CAN0 base: 0x4004.0000

Offset 0x008

Type RO, reset 0x0000.0000

**Register 4: CAN Bit Timing (CANBIT), offset 0x00C**

This register is used to program the bit width and bit quantum. Values are programmed to the system clock frequency. This register is write-enabled by setting the CCE and INIT bits in the **CANCTL** register. See “Bit Time and Bit Rate” on page 1023 for more information.

| 14:12     | TSEG2    | RW   | 0x2    | Time Segment after Sample Point<br>0x00-0x07: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>So, for example, the reset value of 0x2 means that 3 (2+1) bit time quanta are defined for Phase2 (see Figure 17-4 on page 1024). The bit time quanta is defined by the BRP field.                                                                                                                                                                 |
| 11:8      | TSEG1    | RW   | 0x3    | Time Segment Before Sample Point<br>0x00-0x0F: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>So, for example, the reset value of 0x3 means that 4 (3+1) bit time quanta are defined for Phase1 (see Figure 17-4 on page 1024). The bit time quanta is defined by the BRP field.                                                                                                                                                                |
| 7:6       | SJW      | RW   | 0x0    | (Re)Synchronization Jump Width<br>0x00-0x03: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>During the start of frame (SOF), if the CAN controller detects a phase error (misalignment), it can adjust the length of TSEG2 or TSEG1 by the value in SJW. So the reset value of 0 adjusts the length by 1 bit time quanta.                                                                                                                       |
| 5:0       | BRP      | RW   | 0x1    | Baud Rate Prescaler<br>The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quantum.<br>0x00-0x03F: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>BRP defines the number of CAN clock periods that make up 1 bit time quanta, so the reset value is 2 bit time quanta (1+1).<br>The <b>CANBRPE</b> register can be used to further divide the bit time. |

**Register 5: CAN Interrupt (CANINT), offset 0x010**

This register indicates the source of the interrupt.

If several interrupts are pending, the **CAN Interrupt (CANINT)** register points to the pending interrupt with the highest priority, disregarding the order in which the interrupts occurred. An interrupt remains pending until the CPU has cleared it. If the INTID field is not 0x0000 (the default) and the IE bit in the **CANCTL** register is set, the interrupt is active. The interrupt line remains active until the INTID field is cleared by reading the **CANSTS** register, or until the IE bit in the **CANCTL** register is cleared.

**Note:** Reading the **CAN Status (CANSTS)** register clears the **CAN Interrupt (CANINT)** register, if it is pending.

**Register 7: CAN Baud Rate Prescaler Extension (CANBRPE), offset 0x018**

This register is used to further divide the bit time set with the BRP bit in the **CANBIT** register. It is write-enabled by setting the CCE bit in the **CANCTL** register.

**CAN Baud Rate Prescaler Extension (CANBRPE)**

**Register 8: CAN IF1 Command Request (CANIF1CRQ), offset 0x020****Register 9: CAN IF2 Command Request (CANIF2CRQ), offset 0x080**

A message transfer is started as soon as there is a write of the message object number to the MNUM field when the TXRQST bit in the **CANIF1MCTL** register is set. With this write operation, the BUSY bit is automatically set to indicate that a transfer between the CAN Interface Registers and the internal message RAM is in progress. After a wait time of 3 to 6 CAN\_CLK periods, the transfer between the interface register and the message RAM completes, which then clears the BUSY bit.

**Register 10: CAN IF1 Command Mask (CANIF1CMSK), offset 0x024****Register 11: CAN IF2 Command Mask (CANIF2CMSK), offset 0x084**

Reading the Command Mask registers provides status for various functions. Writing to the Command Mask registers specifies the transfer direction and selects which buffer registers are the source or target of the data transfer.

Note that when a read from the message object buffer occurs when the WRNRD bit is clear and the CLRINTPND and/or NEWDAT bits are set, the interrupt pending and/or new data flags in the message object buffer are cleared.

**CAN IFn Command Mask (CANIFnCMSK)**

CAN0 base: 0x4004.0000

Offset 0x024

**Register 12: CAN IF1 Mask 1 (CANIF1MSK1), offset 0x028****Register 13: CAN IF2 Mask 1 (CANIF2MSK1), offset 0x088**

The mask information provided in this register accompanies the data (**CANIFnDAn**), arbitration information (**CANIFnARBn**), and control information (**CANIFnMCTL**) to the message object in the message RAM. The mask is used with the ID bit in the **CANIFnARBn** register for acceptance filtering. Additional mask information is contained in the **CANIFnMSK2** register.

**CAN IFn Mask 1 (CANIFnMSK1)**

CAN0 base: 0x4004.0000

Offset 0x028

Type RW, reset 0x0000.FFFF

**Register 29: CAN IF2 Data B2 (CANIF2DB2), offset 0x0A8**

These registers contain the data to be sent or that has been received. In a CAN data frame, data byte 0 is the first byte to be transmitted or received and data byte 7 is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte is transmitted first.

**Register 30: CAN Transmission Request 1 (CANTXRQ1), offset 0x100****Register 31: CAN Transmission Request 2 (CANTXRQ2), offset 0x104**

The **CANTXRQ1** and **CANTXRQ2** registers hold the TXRQST bits of the 32 message objects. By reading out these bits, the CPU can check which message object has a transmission request pending. The TXRQST bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a remote frame, or (3) the message handler state machine after a successful transmission.

The **CANTXRQ1** register contains the TXRQST bits of the first 16 message objects in the message RAM; the **CANTXRQ2** register contains the TXRQST bits of the second 16 message objects.

**Register 32: CAN New Data 1 (CANNWDA1), offset 0x120****Register 33: CAN New Data 2 (CANNWDA2), offset 0x124**

The **CANNWDA1** and **CANNWDA2** registers hold the NEWDAT bits of the 32 message objects. By reading these bits, the CPU can check which message object has its data portion updated. The NEWDAT bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a data frame, or (3) the message handler state machine after a successful transmission.

The **CANNWDA1** register contains the NEWDAT bits of the first 16 message objects in the message RAM; the **CANNWDA2** register contains the NEWDAT bits of the second 16 message objects.

**Register 34: CAN Message 1 Interrupt Pending (CANMSG1INT), offset 0x140****Register 35: CAN Message 2 Interrupt Pending (CANMSG2INT), offset 0x144**

The **CANMSG1INT** and **CANMSG2INT** registers hold the INTPND bits of the 32 message objects. By reading these bits, the CPU can check which message object has an interrupt pending. The INTPND bit of a specific message object can be changed through two sources: (1) the CPU via the **CANIFnMCTL** register, or (2) the message handler state machine after the reception or transmission of a frame.

This field is also encoded in the **CANINT** register.

The **CANMSG1INT** register contains the INTPND bits of the first 16 message objects in the message RAM; the **CANMSG2INT** register contains the INTPND bits of the second 16 message objects.

## 18 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin. See “Signal Description” on page 1060 for more information.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The TM4C1231E6PM microcontroller provides two independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 18.1 Block Diagram

Figure 18-1. Analog Comparator Module Block Diagram

**Note:** This block diagram depicts the maximum number of analog comparators and comparator outputs for the family of microcontrollers; the number for this specific device may vary. See page 1073 for what is included on this device.

## 18.2 Signal Description

The following table lists the external signals of the Analog Comparators and describes the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 635) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 652) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 613.

Table 18-1. Analog Comparators Signals (64LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                         |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 18.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$VIN- < VIN+, VOUT = 1$

$VIN- > VIN+, VOUT = 0$

As shown in Figure 18-2 on page 1061, the input source for VIN- is an external input, Cn -, where n is the analog comparator number. In addition to an external input, Cn+, input sources for VIN+ can be the C0+ or an internal reference, V<sub>REF</sub>.

Figure 18-2. Structure of Comparator Unit

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive one of the external pins (Cno), or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 18.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 18-3 on page 1062. The internal reference is controlled by a single configuration register (**ACREFCTL**).

**Figure 18-3. Comparator Internal Reference Structure**

**Note:** In the figure above,  $N \cdot R$  represents a multiple of the  $R$  value that produces the results specified in Table 18-2 on page 1062.

The internal reference can be programmed in one of two modes (low range or high range) depending on the RNG bit in the **ACREFCTL** register. When RNG is clear, the internal reference is in high-range mode, and when RNG is set the internal reference is in low-range mode.

In each range, the internal reference,  $V_{IREF}$ , has 16 preprogrammed thresholds or step values. The threshold to be used to compare the external input voltage against is selected using the VREF field in the **ACREFCTL** register.

In the high-range mode, the  $V_{IREF}$  threshold voltages start at the ideal high-range starting voltage of  $V_{DDA}/4.2$  and increase in ideal constant voltage steps of  $V_{DDA}/29.4$ .

In the low-range mode, the  $V_{IREF}$  threshold voltages start at 0 V and increase in ideal constant voltage steps of  $V_{DDA}/22.12$ . The ideal  $V_{IREF}$  step voltages for each mode and their dependence on the RNG and VREF fields are summarized in Table 18-2.

**Table 18-2. Internal Reference Voltage and ACREFCTL Field Values**

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                                                                                                                                                        |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF. It is recommended that RNG=1 and VREF=0 to minimize noise on the reference ground.                                                                                                                                                                                                                                                                    |
| EN=1              | RNG=0         | $V_{IREF}$ High Range: 16 voltage threshold values indexed by VREF = 0x0 .. 0xF<br>Ideal starting voltage (VREF=0): $V_{DDA} / 4.2$<br>Ideal step size: $V_{DDA} / 29.4$<br>Ideal $V_{IREF}$ threshold values: $V_{IREF}(VREF) = V_{DDA} / 4.2 + VREF * (V_{DDA} / 29.4)$ , for VREF = 0x0 .. 0xF<br>For minimum and maximum $V_{IREF}$ threshold values, see Table 18-3 on page 1063. |
|                   | RNG=1         | $V_{IREF}$ Low Range: 16 voltage threshold values indexed by VREF = 0x0 .. 0xF<br>Ideal starting voltage (VREF=0): 0 V<br>Ideal step size: $V_{DDA} / 22.12$<br>Ideal $V_{IREF}$ threshold values: $V_{IREF}(VREF) = VREF * (V_{DDA} / 22.12)$ , for VREF = 0x0 .. 0xF<br>For minimum and maximum $V_{IREF}$ threshold values, see Table 18-4 on page 1063.                            |

Note that the values shown in Table 18-2 are the ideal values of the  $V_{IREF}$  thresholds. These values actually vary between minimum and maximum values for each threshold step, depending on process and temperature. The minimum and maximum values for each step are given by:

- $V_{IREF}(VREF) [Min] = \text{Ideal } V_{IREF}(VREF) - (\text{Ideal Step size} - 2 \text{ mV}) / 2$
- $V_{IREF}(VREF) [Max] = \text{Ideal } V_{IREF}(VREF) + (\text{Ideal Step size} - 2 \text{ mV}) / 2$

Examples of minimum and maximum  $V_{IREF}$  values for  $V_{DDA} = 3.3V$  for high and low ranges, are shown in Table 18-3 and Table 18-4. Note that these examples are only valid for  $V_{DDA} = 3.3V$ ; values scale up and down with  $V_{DDA}$ .

**Table 18-3. Analog Comparator Voltage Reference Characteristics,  $V_{DDA} = 3.3V$ ,  $EN = 1$ , and  $RNG = 0$**

| VREF Value | $V_{IREF}$ Min | Ideal $V_{IREF}$ | $V_{IREF}$ Max | Unit |

## 18.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator clock by writing a value of 0x0000.0001 to the **RCGCACMP** register in the System Control module (see page 333).
2. Enable the clock to the appropriate GPIO modules via the **RCGCGPIO** register (see page 321). To find out which GPIO ports to enable, refer to Table 20-5 on page 1090.
3. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 20-4 on page 1086.
4. Configure the PMCn fields in the **GPIOPCTL** register to assign the analog comparator output signals to the appropriate pins (see page 652 and Table 20-5 on page 1090).
5. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
6. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
7. Delay for 10  $\mu$ s.
8. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C- to see the OVAL value change.

## 18.5 Register Map

Table 18-5 on page 1064 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 333). There must be a delay of 3 system clocks after the analog comparator module clock is enabled before any analog comparator module registers are accessed.

**Table 18-5. Analog Comparators Register Map**

| Offset | Name  | Type | Reset       | Description                               | See page |

**Register 2: Analog Comparator Raw Interrupt Status (ACRIS), offset 0x004**

This register provides a summary of the interrupt status (raw) of the comparators. The bits in this register must be enabled to generate interrupts using the **ACINTEN** register.

## 19 Pin Diagram

The TM4C1231E6PM microcontroller pin diagram is shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 20-5 on page 1090.

**Figure 19-1. 64-Pin LQFP Package Pin Diagram**

## 20 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 651) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 635) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 652), which selects one of several available peripheral functions for that GPIO.

**Important:** Table 10-1 on page 614 shows special consideration GPIO pins. Most GPIO pins are configured as GPIOs and tri-stated by default (**GPIOAFSEL**=0, **GPIODEN**=0, **GPIOPDR**=0, **GPIOPUR**=0, and **GPIOPCTL**=0). Special consideration pins may be programmed to a non-GPIO function or may have special commit controls out of reset. In addition, a Power-On-Reset (POR) or asserting RST returns these GPIO to their original special consideration state.

**Table 20-1. GPIO Pins With Special Considerations**

| GPIO Pins | Default Reset State | GPIOAFSEL | GPIODEN | GPIOPDR | GPIOPUR | GPIOPCTL | GPIOCR |
|-----------|---------------------|-----------|---------|---------|---------|----------|--------|
| PA[1:0]   | UART0               | 0         | 0       | 0       | 0       | 0x1      | 1      |
| PA[5:2]   | SSI0                | 0         | 0       | 0       | 0       | 0x2      | 1      |
| PB[3:2]   | I <sup>2</sup> C0   | 0         | 0       | 0       | 0       | 0x3      | 1      |
| PC[3:0]   | JTAG/SWD            | 1         | 1       | 0       | 1       | 0x1      | 0      |
| PD[7]     | GPIO <sup>a</sup>   | 0         | 0       | 0       | 0       | 0x0      | 0      |
| PF[0]     | GPIO <sup>a</sup>   | 0         | 0       | 0       | 0       | 0x0      | 0      |

a. This pin is configured as a GPIO by default but is locked and can only be reprogrammed by unlocking the pin in the **GPIOLOCK** register and uncommitting it by setting the **GPIOCR** register.

Table 20-2 on page 1076 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 20-3 on page 1081 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 20-4 on page 1086 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 20-5 on page 1090 lists the GPIO pins and their analog and digital alternate functions. The AINx analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 20-6 on page 1092 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Tiva™ C Series Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

**Note:** All digital inputs are Schmitt triggered.

## 20.1 Signals by Pin Number

**Table 20-2. Signals by Pin Number**

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                              |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|            | T1CCP1   | I/O      | TTL                      | 16/32-Bit Timer 1 Capture/Compare/PWM 1.                                                                                                                                                                                                         |
|            | TRCLK    | O        | TTL                      | Trace clock.                                                                                                                                                                                                                                     |
| 32         | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                 |
| 33         | HIB      | O        | TTL                      | An output that indicates the processor is in Hibernate mode.                                                                                                                                                                                     |
| 34         | XOSC0    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 32.768-kHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC.                                                       |
| 35         | GNDX     | -        | Power                    | GND for the Hibernation oscillator. When using a crystal clock source, this pin should be connected to digital ground along with the crystal load capacitors. When using an external oscillator, this pin should be connected to digital ground. |
| 36         | XOSC1    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                          |
| 37         | VBAT     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                 |
| 38         | RST      | I        | TTL                      | System reset input.                                                                                                                                                                                                                              |
| 39         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                         |
| 40         | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                                                                                              |
| 41         | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                        |
| 42         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                          |

Table 20-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                      |
|------------|----------|----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 43         | PD4      | I/O      | TTL                      | GPIO port D bit 4. This pin is not 5-V tolerant.                                                                                                 |
|            | U6Rx     | I        | TTL                      | UART module 6 receive.                                                                                                                           |
|            | WT4CCP0  | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 0.                                                                                                    |
| 44         | PD5      | I/O      | TTL                      | GPIO port D bit 5. This pin is not 5-V tolerant.                                                                                                 |
|            | U6Tx     | O        | TTL                      | UART module 6 transmit.                                                                                                                          |
|            | WT4CCP1  | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 1.                                                                                                    |
| 45         | PB0      | I/O      | TTL                      | GPIO port B bit 0. This pin is not 5-V tolerant.                                                                                                 |
|            | T2CCP0   | I/O      | TTL                      | 16/32-Bit Timer 2 Capture/Compare/PWM 0.                                                                                                         |

Table 20-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                       |
|------------|----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 56         | VDDC     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 21-12 on page 1110 . |
| 57         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                                                                                                                                                                                                                                                |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                                                                                                                                                                                                                                             |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                                                                                                                                                                                                            |
|            | SSI2Fss  | I/O      | TTL                      | SSI module 2 frame signal.                                                                                                                                                                                                                                                                        |

Table 20-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                   |
|------------|----------|----------|--------------------------|-----------------------------------------------|
| 63         | PD2      | I/O      | TTL                      | GPIO port D bit 2.                            |
|            | AIN5     | I        | Analog                   | Analog-to-digital converter input 5.          |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                         |
|            | SSI3Rx   | I        | TTL                      | SSI module 3 receive.                         |
|            | WT3CCP0  | I/O      | TTL                      | 32/64-Bit Wide Timer 3 Capture/Compare/PWM 0. |
| 64         | PD3      | I/O      | TTL                      | GPIO port D bit 3.                            |
|            | AIN4     | I        | Analog                   | Analog-to-digital converter input 4.          |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                        |
|            | SSI3Tx   | O        | TTL                      | SSI module 3 transmit.                        |
|            | WT3CCP1  | I/O      | TTL                      | 32/64-Bit Wide Timer 3 Capture/Compare/PWM 1. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.2 Signals by Signal Name

Table 20-3. Signals by Signal Name

| Pin Name | Pin Number     | Pin Mux / Pin Assignment      | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|----------------|-------------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | 6              | PE3                           | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | 7              | PE2                           | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | 8              | PE1                           | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | 9              | PE0                           | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | 64             | PD3                           | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | 63             | PD2                           | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | 62             | PD1                           | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | 61             | PD0                           | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | 60             | PE5                           | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | 59             | PE4                           | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | 58             | PB4                           | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | 57             | PB5                           | I        | Analog                   | Analog-to-digital converter input 11. |
| C0+      | 14             | PC6                           | I        | Analog                   | Analog comparator 0 positive input.   |
| C0-      | 13             | PC7                           | I        | Analog                   | Analog comparator 0 negative input.   |
| C0o      | 28             | PF0 (9)                       | O        | TTL                      | Analog comparator 0 output.           |
| C1+      | 15             | PC5                           | I        | Analog                   | Analog comparator 1 positive input.   |
| C1-      | 16             | PC4                           | I        | Analog                   | Analog comparator 1 negative input.   |
| C1o      | 29             | PF1 (9)                       | O        | TTL                      | Analog comparator 1 output.           |
| CAN0Rx   | 28<br>58<br>59 | PF0 (3)<br>PB4 (8)<br>PE4 (8) | I        | TTL                      | CAN module 0 receive.                 |
| CAN0Tx   | 31<br>57<br>60 | PF3 (3)<br>PB5 (8)<br>PE5 (8) | O        | TTL                      | CAN module 0 transmit.                |

Table 20-3. Signals by Signal Name (continued)

| Pin Name | Pin Number           | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                      |
|----------|----------------------|--------------------------|----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GND      | 12<br>27<br>39<br>55 | fixed                    | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                         |
| GNDA     | 3                    | fixed                    | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                |
| GNDX     | 35                   | fixed                    | -        | Power                    | GND for the Hibernation oscillator. When using a crystal clock source, this pin should be connected to digital ground along with the crystal load capacitors. When using an external oscillator, this pin should be connected to digital ground. |
| HIB      | 33                   | fixed                    | O        | TTL                      | An output that indicates the processor is in Hibernate mode.                                                                                                                                                                                     |
| I2C0SCL  | 47                   | PB2 (3)                  | I/O      | OD                       | I <sup>2</sup> C module 0 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                 |
| I2C0SDA  | 48                   | PB3 (3)                  | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                  |
| I2C1SCL  | 23                   | PA6 (3)                  | I/O      | OD                       | I <sup>2</sup> C module 1 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                 |

| VBAT     | 37                   | fixed                    | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                                         |
| VDD      | 11<br>26<br>42<br>54 | fixed                    | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
| VDDA     | 2                    | fixed                    | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 21-5 on page 1097, regardless of system implementation. |
| VDDC     | 25<br>56             | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 21-12 on page 1110.                                         |
| WAKE     | 32                   | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernation mode when asserted.                                                                                                                                                                                                                                                       |

| WT5CCP1  | 10         | PD7 (7)                  | I/O      | TTL                      | 32/64-Bit Wide Timer 5 Capture/Compare/PWM 1.                                                                                                                                              |
| XOSC0    | 34         | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 32.768-kHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. |
| XOSC1    | 36         | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                    |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.3 Signals by Function, Except for GPIO

Table 20-4. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|--------------------|----------|------------|----------|--------------------------|---------------------------------------|
| ADC                | AIN0     | 6          | I        | Analog                   | Analog-to-digital converter input 0.  |
|                    | AIN1     | 7          | I        | Analog                   | Analog-to-digital converter input 1.  |
|                    | AIN2     | 8          | I        | Analog                   | Analog-to-digital converter input 2.  |
|                    | AIN3     | 9          | I        | Analog                   | Analog-to-digital converter input 3.  |
|                    | AIN4     | 64         | I        | Analog                   | Analog-to-digital converter input 4.  |
|                    | AIN5     | 63         | I        | Analog                   | Analog-to-digital converter input 5.  |
|                    | AIN6     | 62         | I        | Analog                   | Analog-to-digital converter input 6.  |
|                    | AIN7     | 61         | I        | Analog                   | Analog-to-digital converter input 7.  |
|                    | AIN8     | 60         | I        | Analog                   | Analog-to-digital converter input 8.  |
|                    | AIN9     | 59         | I        | Analog                   | Analog-to-digital converter input 9.  |
|                    | AIN10    | 58         | I        | Analog                   | Analog-to-digital converter input 10. |
|                    | AIN11    | 57         | I        | Analog                   | Analog-to-digital converter input 11. |
| Analog Comparators | C0+      | 14         | I        | Analog                   | Analog comparator 0 positive input.   |
|                    | C0-      | 13         | I        | Analog                   | Analog comparator 0 negative input.   |
|                    | C0o      | 28         | O        | TTL                      | Analog comparator 0 output.           |
|                    | C1+      | 15         | I        | Analog                   | Analog comparator 1 positive input.   |
|                    | C1-      | 16         | I        | Analog                   | Analog comparator 1 negative input.   |
|                    | C1o      | 29         | O        | TTL                      | Analog comparator 1 output.           |

Table 20-4. Signals by Function, Except for GPIO (continued)

| Function                | Pin Name | Pin Number     | Pin Type | Buffer Type <sup>a</sup> | Description                                   |
|-------------------------|----------|----------------|----------|--------------------------|-----------------------------------------------|
| Controller Area Network | CAN0Rx   | 28<br>58<br>59 | I        | TTL                      | CAN module 0 receive.                         |
|                         | CAN0Tx   | 31<br>57<br>60 | O        | TTL                      | CAN module 0 transmit.                        |
| Core                    | TRCLK    | 31             | O        | TTL                      | Trace clock.                                  |
|                         | TRD0     | 30             | O        | TTL                      | Trace data 0.                                 |
|                         | TRD1     | 29             | O        | TTL                      | Trace data 1.                                 |
| General-Purpose Timers  | T0CCP0   | 1<br>28        | I/O      | TTL                      | 16/32-Bit Timer 0 Capture/Compare/PWM 0.      |

|                         | T4CCP0   | 52             | I/O      | TTL                      | 16/32-Bit Timer 4 Capture/Compare/PWM 0.      |
|                         | T4CCP1   | 51             | I/O      | TTL                      | 16/32-Bit Timer 4 Capture/Compare/PWM 1.      |
|                         | T5CCP0   | 50             | I/O      | TTL                      | 16/32-Bit Timer 5 Capture/Compare/PWM 0.      |
|                         | T5CCP1   | 49             | I/O      | TTL                      | 16/32-Bit Timer 5 Capture/Compare/PWM 1.      |
|                         | WT0CCP0  | 16             | I/O      | TTL                      | 32/64-Bit Wide Timer 0 Capture/Compare/PWM 0. |
|                         | WT0CCP1  | 15             | I/O      | TTL                      | 32/64-Bit Wide Timer 0 Capture/Compare/PWM 1. |
|                         | WT1CCP0  | 14             | I/O      | TTL                      | 32/64-Bit Wide Timer 1 Capture/Compare/PWM 0. |
|                         | WT1CCP1  | 13             | I/O      | TTL                      | 32/64-Bit Wide Timer 1 Capture/Compare/PWM 1. |
|                         | WT2CCP0  | 61             | I/O      | TTL                      | 32/64-Bit Wide Timer 2 Capture/Compare/PWM 0. |
|                         | WT2CCP1  | 62             | I/O      | TTL                      | 32/64-Bit Wide Timer 2 Capture/Compare/PWM 1. |
|                         | WT3CCP0  | 63             | I/O      | TTL                      | 32/64-Bit Wide Timer 3 Capture/Compare/PWM 0. |
|                         | WT3CCP1  | 64             | I/O      | TTL                      | 32/64-Bit Wide Timer 3 Capture/Compare/PWM 1. |
|                         | WT4CCP0  | 43             | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 0. |
|                         | WT4CCP1  | 44             | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 1. |
|                         | WT5CCP0  | 53             | I/O      | TTL                      | 32/64-Bit Wide Timer 5 Capture/Compare/PWM 0. |
|                         | WT5CCP1  | 10             | I/O      | TTL                      | 32/64-Bit Wide Timer 5 Capture/Compare/PWM 1. |

Table 20-4. Signals by Function, Except for GPIO (*continued*)

| Function     | Pin Name | Pin Number | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                      |
|--------------|----------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hibernate    | GNDX     | 35         | -        | Power                    | GND for the Hibernation oscillator. When using a crystal clock source, this pin should be connected to digital ground along with the crystal load capacitors. When using an external oscillator, this pin should be connected to digital ground. |
|              | HIB      | 33         | O        | TTL                      | An output that indicates the processor is in Hibernate mode.                                                                                                                                                                                     |
|              | VBAT     | 37         | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                 |
|              | WAKE     | 32         | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                 |
|              | XOSC0    | 34         | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 32.768-kHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC.                                                       |
|              | XOSC1    | 36         | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                          |
| I2C          | I2C0SCL  | 47         | I/O      | OD                       | I <sup>2</sup> C module 0 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                 |

Table 20-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number           | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                              |
|----------|----------|----------------------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power    | GND      | 12<br>27<br>39<br>55 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                 |
|          | GNDA     | 3                    | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                                        |
|          | VDD      | 11<br>26<br>42<br>54 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
|          | VDDA     | 2                    | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 21-5 on page 1097, regardless of system implementation. |
|          | VDDC     | 25<br>56             | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 21-12 on page 1110.                                         |
| SSI      | SSI0Clk  | 19                   | I/O      | TTL                      | SSI module 0 clock                                                                                                                                                                                                                                                                                                                       |
|          | SSI0Fss  | 20                   | I/O      | TTL                      | SSI module 0 frame signal                                                                                                                                                                                                                                                                                                                |
|          | SSI0Rx   | 21                   | I        | TTL                      | SSI module 0 receive                                                                                                                                                                                                                                                                                                                     |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.4 GPIO Pins and Alternate Functions

Table 20-5. GPIO Pins and Alternate Functions

## 20.6 Connections for Unused Signals

Table 20-7 on page 1094 shows how to handle signals for functions that are not used in a particular system implementation for devices that are in a 64-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 20-7. Connections for Unused Signals (64-Pin LQFP)

| Function       | Signal Name      | Pin Number                                    | Acceptable Practice | Preferred Practice                         |
|----------------|------------------|-----------------------------------------------|---------------------|--------------------------------------------|
| GPIO           | All unused GPIOs | -                                             | NC                  | GND                                        |
| Hibernate      | HIB              | 33                                            | NC                  | NC                                         |
|                | VBAT             | 37                                            | NC                  | VDD                                        |
|                | WAKE             | 32                                            | NC                  | GND                                        |
|                | X0SC0            | 34                                            | NC                  | GND                                        |
|                | X0SC1            | 36                                            | NC                  | NC                                         |
|                | GNDX             | 35                                            | GND                 | GND                                        |
| No Connects    | NC               | See NC pin numbers in Table 20-3 on page 1081 | NC                  | NC                                         |
| System Control | OSC0             | 40                                            | NC                  | GND                                        |
|                | OSC1             | 41                                            | NC                  | NC                                         |
|                | RST              | 38                                            | VDD                 | Pull up as shown in Figure 5-1 on page 205 |

## 21 Electrical Characteristics

### 21.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Device reliability may be adversely affected by exposure to absolute-maximum ratings for extended periods.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 21-1. Absolute Maximum Ratings**

| Parameter             | Parameter Name <sup>a</sup>                                                                 | Value |                       | Unit |
|-----------------------|---------------------------------------------------------------------------------------------|-------|-----------------------|------|
|                       |                                                                                             | Min   | Max                   |      |
| V <sub>DD</sub>       | V <sub>DD</sub> supply voltage                                                              | 0     | 4                     | V    |
| V <sub>DDA</sub>      | V <sub>DDA</sub> supply voltage <sup>b</sup>                                                | 0     | 4                     | V    |
| V <sub>BAT</sub>      | V <sub>BAT</sub> battery supply voltage                                                     | 0     | 4                     | V    |
| V <sub>BATRMP</sub>   | V <sub>BAT</sub> battery supply voltage ramp time                                           | 0     | 0.7                   | V/μs |
| V <sub>IN_GPIO</sub>  | Input voltage on GPIOs, regardless of whether the microcontroller is powered <sup>cde</sup> | -0.3  | 5.5                   | V    |
|                       | Input voltage for PD4, PD5, PB0 and PB1 when configured as GPIO                             | -0.3  | V <sub>DD</sub> + 0.3 | V    |
| I <sub>GPIO MAX</sub> | Maximum current per output pin                                                              | -     | 25                    | mA   |
| T <sub>S</sub>        | Unpowered storage temperature range                                                         | -65   | 150                   | °C   |
| T <sub>JMAX</sub>     | Maximum junction temperature                                                                | -     | 150                   | °C   |

a. Voltages are measured with respect to GND.

b. To ensure proper operation, V<sub>DDA</sub> must be powered before V<sub>DD</sub> if sourced from different supplies, or connected to the same supply as V<sub>DD</sub>. Note that the minimum operating voltage for V<sub>DD</sub> differs from the minimum operating voltage for V<sub>DDA</sub>. This change should be accounted for in the system design if both are sourced from the same supply. There is not a restriction on order for powering off.

c. Applies to static and dynamic signals including overshoot.

d. Refer to Figure 21-16 on page 1123 for a representation of the ESD protection on GPIOs.

e. For additional details, see the note on GPIO pad tolerance in "GPIO Module Characteristics" on page 1122.

**Important:** This device contains circuitry to protect the I/Os against damage due to high-static voltages; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (see "Connections for Unused Signals" on page 1094).

**Table 21-2. ESD Absolute Maximum Ratings**

|                                                 | Parameter                        | Min | Nom | Max | Unit |
|-------------------------------------------------|----------------------------------|-----|-----|-----|------|
| Component-Level ESD Stress Voltage <sup>a</sup> | V <sub>ESDHB</sub> <sup>b</sup>  | -   | -   | 2.0 | kV   |
|                                                 | V <sub>ESDCDM</sub> <sup>c</sup> | -   | -   | 500 | V    |

a. Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges in device.

b. Level listed is passing level per ANSI/ESDA/JEDEC JS-001. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

c. Level listed is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

## 21.2 Operating Characteristics

**Table 21-3. Temperature Characteristics**

| Characteristic                       | Symbol | Value      | Unit |
|--------------------------------------|--------|------------|------|
| Ambient operating temperature range  | $T_A$  | -40 to +85 | °C   |
| Case operating temperature range     | $T_C$  | -40 to +93 | °C   |
| Junction operating temperature range | $T_J$  | -40 to +96 | °C   |

**Table 21-4. Thermal Characteristics<sup>a</sup>**

| Characteristic                                        | Symbol        | Value                                                                                                                                     | Unit |
|-------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|------|
| Thermal resistance (junction to ambient) <sup>b</sup> | $\Theta_{JA}$ | 54.8                                                                                                                                      | °C/W |
| Thermal resistance (junction to board) <sup>b</sup>   | $\Theta_{JB}$ | 27.5                                                                                                                                      | °C/W |
| Thermal resistance (junction to case) <sup>b</sup>    | $\Theta_{JC}$ | 15.8                                                                                                                                      | °C/W |
| Thermal metric (junction to top of package)           | $\Psi_{JT}$   | 0.7                                                                                                                                       | °C/W |
| Thermal metric (junction to board)                    | $\Psi_{JB}$   | 27.1                                                                                                                                      | °C/W |
| Junction temperature formula                          | $T_J$         | $T_C + (P \cdot \Psi_{JT})$<br>$T_{PCB} + (P \cdot \Psi_{JB})^c$<br>$T_A + (P \cdot \Theta_{JA})^d$<br>$T_B + (P \cdot \Theta_{JB})^{ef}$ | °C   |

a. For more details about thermal metrics and definitions, see the *Semiconductor and IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)).

b. Junction to ambient thermal resistance ( $\Theta_{JA}$ ), junction to board thermal resistance ( $\Theta_{JB}$ ), and junction to case thermal resistance ( $\Theta_{JC}$ ) numbers are determined by a package simulator.

c.  $T_{PCB}$  is the temperature of the board acquired by following the steps listed in the EAI/JESD 51-8 standard summarized in the *Semiconductor and IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)).

d. Because  $\Theta_{JA}$  is highly variable and based on factors such as board design, chip/pad size, altitude, and external ambient temperature, it is recommended that equations containing  $\Psi_{JT}$  and  $\Psi_{JB}$  be used for best results.

e.  $T_B$  is temperature of the board.

f.  $\Theta_{JB}$  is not a pure reflection of the internal resistance of the package because it includes the resistance of the testing board and environment. It is recommended that equations containing  $\Psi_{JT}$  and  $\Psi_{JB}$  be used for best results.

## 21.3 Recommended Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the  $V_{OL}$  value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 21-5. Recommended DC Operating Conditions**

| Parameter        | Parameter Name                            | Min  | Nom | Max  | Unit |
|------------------|-------------------------------------------|------|-----|------|------|
| $V_{DD}$         | $V_{DD}$ supply voltage                   | 3.15 | 3.3 | 3.63 | V    |
| $V_{DDA}$        | $V_{DDA}$ supply voltage                  | 2.97 | 3.3 | 3.63 | V    |
| $V_{DDC}$        | $V_{DDC}$ supply voltage                  | 1.08 | 1.2 | 1.32 | V    |
| $V_{DDCDS}^{ab}$ | $V_{DDC}$ supply voltage, Deep-sleep mode | 1.08 | -   | 1.32 | V    |

a. These values are valid when LDO is in operation.

b. There are peripheral timing restrictions for SSI and LPC in Deep-sleep mode. Please refer to those peripheral characteristic sections for more information.

**Table 21-6. Recommended GPIO Pad Operating Conditions**

| Parameter | Parameter Name                              | Min             | Nom | Max             | Unit |
|-----------|---------------------------------------------|-----------------|-----|-----------------|------|
| $V_{IH}$  | GPIO high-level input voltage               | $0.65 * V_{DD}$ | -   | 5.5             | V    |
| $V_{IL}$  | GPIO low-level input voltage                | 0               | -   | $0.35 * V_{DD}$ | V    |
| $V_{HYS}$ | GPIO input hysteresis                       | 0.2             | -   | -               | V    |
| $V_{OH}$  | GPIO high-level output voltage              | 2.4             | -   | -               | V    |
| $V_{OL}$  | GPIO low-level output voltage               | -               | -   | 0.4             | V    |
| $I_{OH}$  | High-level source current, $V_{OH}=2.4 V^a$ |                 |     |                 |      |
|           | 2-mA Drive                                  | 2.0             | -   | -               | mA   |
|           | 4-mA Drive                                  | 4.0             | -   | -               | mA   |
|           | 8-mA Drive                                  | 8.0             | -   | -               | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4 V^a$    |                 |     |                 |      |
|           | 2-mA Drive                                  | 2.0             | -   | -               | mA   |
|           | 4-mA Drive                                  | 4.0             | -   | -               | mA   |
|           | 8-mA Drive                                  | 8.0             | -   | -               | mA   |
|           | 8-mA Drive, $V_{OL}=1.2 V$                  | 18.0            | -   | -               | mA   |

a.  $I_O$  specifications reflect the maximum current where the corresponding output voltage meets the  $V_{OH}/V_{OL}$  thresholds.  $I_O$  current can exceed these limits (subject to absolute maximum ratings).

**Table 21-7. GPIO Current Restrictions<sup>a</sup>**

| Parameter  | Parameter Name                                                | Min | Nom | Max | Unit |
|------------|---------------------------------------------------------------|-----|-----|-----|------|
| $I_{MAXL}$ | Cumulative maximum GPIO current per side, left <sup>b</sup>   | -   | -   | 30  | mA   |
| $I_{MAXB}$ | Cumulative maximum GPIO current per side, bottom <sup>b</sup> | -   | -   | 35  | mA   |
| $I_{MAXR}$ | Cumulative maximum GPIO current per side, right <sup>b</sup>  | -   | -   | 40  | mA   |
| $I_{MAXT}$ | Cumulative maximum GPIO current per side, top <sup>b</sup>    | -   | -   | 40  | mA   |

a. Based on design simulations, not tested in production.

b. Sum of sink and source current for GPIOs as shown in Table 21-8 on page 1098.

**Table 21-8. GPIO Package Side Assignments**

| Side   | GPIOs                                |
|--------|--------------------------------------|
| Left   | PB[6-7], PC[4-7], PD7, PE[0-3], PF4  |
| Bottom | PA[0-7], PF[0-3]                     |
| Right  | PB[0-3], PD[4-5]                     |
| Top    | PB[4-5], PC[0-3], PD[0-3,6], PE[4-5] |

## 21.4 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

**Figure 21-1. Load Conditions**

## 21.5 JTAG and Boundary Scan

Table 21-9. JTAG Characteristics

| Parameter No. | Parameter       | Parameter Name                                                            | Min | Nom         | Max | Unit |
|---------------|-----------------|---------------------------------------------------------------------------|-----|-------------|-----|------|
| J1            | $F_{TCK}$       | TCK operational clock frequency <sup>a</sup>                              | 0   | -           | 10  | MHz  |
| J2            | $T_{TCK}$       | TCK operational clock period                                              | 100 | -           | -   | ns   |
| J3            | $T_{TCK\_LOW}$  | TCK clock Low time                                                        | -   | $t_{TCK}/2$ | -   | ns   |
| J4            | $T_{TCK\_HIGH}$ | TCK clock High time                                                       | -   | $t_{TCK}/2$ | -   | ns   |
| J5            | $T_{TCK\_R}$    | TCK rise time                                                             | 0   | -           | 10  | ns   |
| J6            | $T_{TCK\_F}$    | TCK fall time                                                             | 0   | -           | 10  | ns   |
| J7            | $T_{TMS\_SU}$   | TMS setup time to TCK rise                                                | 8   | -           | -   | ns   |
| J8            | $T_{TMS\_HLD}$  | TMS hold time from TCK rise                                               | 4   | -           | -   | ns   |
| J9            | $T_{TDI\_SU}$   | TDI setup time to TCK rise                                                | 18  | -           | -   | ns   |
| J10           | $T_{TDI\_HLD}$  | TDI hold time from TCK rise                                               | 4   | -           | -   | ns   |
| J11           | $T_{TDO\_ZDV}$  | TCK fall to Data Valid from High-Z, 2-mA drive                            | -   | 13          | 35  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 4-mA drive                            |     | 9           | 26  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 8-mA drive                            |     | 8           | 26  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 8-mA drive with slew rate control     |     | 10          | 29  | ns   |
| J12           | $T_{TDO\_DV}$   | TCK fall to Data Valid from Data Valid, 2-mA drive                        | -   | 14          | 20  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 4-mA drive                        |     | 10          | 26  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 8-mA drive                        |     | 8           | 21  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 8-mA drive with slew rate control |     | 10          | 26  | ns   |
| J13           | $T_{TDO\_DVZ}$  | TCK fall to High-Z from Data Valid, 2-mA drive                            | -   | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 4-mA drive                            |     | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 8-mA drive                            |     | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 8-mA drive with slew rate control     |     | 8           | 19  | ns   |

a. A ratio of at least 8:1 must be kept between the system clock and TCK.

## 21.6 Power and Brown-Out

Table 21-10. Power-On and Brown-Out Levels

| Parameter No. | Parameter          | Parameter Name                         | Min   | Nom  | Max      | Unit    |
|---------------|--------------------|----------------------------------------|-------|------|----------|---------|
| P1            | $T_{VDDA\_RISE}$   | Analog Supply Voltage (VDDA) Rise Time | -     | -    | $\infty$ | $\mu s$ |
| P2            | $T_{VDD\_RISE}$    | I/O Supply Voltage (VDD) Rise Time     | -     | -    | $\infty$ | $\mu s$ |
| P3            | $T_{VDDC\_RISE}^a$ | Core Supply Voltage (VDDC) Rise Time   | 10.00 | -    | 150.00   | $\mu s$ |
| P4            | $V_{POR}$          | Power-On Reset Threshold               | 2.00  | 2.30 | 2.60     | V       |
| P5            | $V_{VDDA\_POK}$    | VDDA Power-OK Threshold (Rising Edge)  | 2.70  | 2.85 | 3.00     | V       |
|               |                    | VDDA Power-OK Threshold (Falling Edge) | 2.71  | 2.80 | 2.89     | V       |
| P6            | $V_{VDD\_POK}^b$   | VDD Power-OK Threshold (Rising Edge)   | 2.85  | 3.00 | 3.15     | V       |
|               |                    | VDD Power-OK Threshold (Falling Edge)  | 2.70  | 2.78 | 2.87     | V       |
| P7            | $V_{VDD\_BOR0}$    | Brown-Out 0 Reset Threshold            | 2.93  | 3.02 | 3.11     | V       |
| P8            | $V_{VDD\_BOR1}$    | Brown-Out 1 Reset Threshold            | 2.83  | 2.92 | 3.01     | V       |
| P9            | $V_{VDDC\_POK}$    | VDDC Power-OK Threshold (Rising Edge)  | 0.80  | 0.95 | 1.10     | V       |
|               |                    | VDDC Power-OK Threshold (Falling Edge) | 0.71  | 0.80 | 0.89     | V       |

a. The MIN and MAX values are guaranteed by design assuming the external filter capacitor load is within the range of CLDO. Please refer to "On-Chip Low Drop-Out (LDO) Regulator" on page 1110 for the CLDO value.

b. Digital logic, Flash memory, and SRAM are all designed to operate at VDD voltages below 2.70 V. The internal POK reset protects the device from unpredictable operation on power down.

### 21.6.1 VDDA Levels

The  $V_{DDA}$  supply has two monitors:

- Power-On Reset (POR)
- Power-OK (POK)

The POR monitor is used to keep the analog circuitry in reset until the  $V_{DDA}$  supply has reached the correct range for the analog circuitry to begin operating. The POK monitor is used to keep the digital circuitry in reset until the  $V_{DDA}$  power supply is at an acceptable operational level. The digital Power-On Reset (**Digital POR**) is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges.

Once the  $V_{DDA}$  POK monitor has released the digital Power-On Reset on the initial power-up, voltage drops on the  $V_{DDA}$  supply will only be reflected in the following bits. The digital Power-On Reset will not be re-asserted.

- VDDARIS bit in the **Raw Interrupt Status (RIS)** register (see page 232).
- VDDAMIS bit in the **Masked Interrupt Status and Clear (MISC)** register (see page 236). This bit is set only if the VDDAIM bit in the **Interrupt Mask Control (IMC)** register has been set.

Figure 21-4 on page 1103 shows the relationship between  $V_{DDA}$ , POR, POK, and an interrupt event.

Figure 21-4. Power Assertions versus VDDA Levels

## 21.6.2 VDD Levels

The  $V_{DD}$  supply has three monitors:

- Power-OK (POK)
- Brown-Out Reset0 (BOR0)
- Brown-Out Reset1 (BOR1)

The POK monitor is used to keep the digital circuitry in reset until the  $V_{DD}$  power supply is at an acceptable operational level. The digital Power-On Reset (Digital POR) is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges. The BOR0 and the BOR1 monitors are used to generate a reset to the device or assert an interrupt if the  $V_{DD}$  supply drops below its operational range. The BOR1 monitor's threshold is in between the BOR0 and POK thresholds.

If either a BOR0 event or a BOR1 event occurs, the following bits are affected:

- BOR0RIS or BOR1RIS bits in the **Raw Interrupt Status (RIS)** register (see page 232).
- BOR0MIS or BOR1MIS bits in the **Masked Interrupt Status and Clear (MISC)** register (see page 236). These bits are set only if the respective BOR0IM or BOR1IM bits in the **Interrupt Mask Control (IMC)** register have been set.
- BOR bit in the **Reset Cause (RESC)** register (see page 239). This bit is set only if either of the BOR0 or BOR1 events have been configured to initiate a reset.

In addition, the following bits control both the BOR0 and BOR1 events:

- BOR0IM or BOR1IM bits in the **Interrupt Mask Control (IMC)** register (see page 234).

- BOR0 or BOR1 bits in the **Power-On and Brown-Out Reset Control (PBORCTL)** register (see page 231).

Figure 21-5 on page 1104 shows the relationship between:

- $V_{DD}$ , POK, and a BOR0 event
- $V_{DD}$ , POK, and a BOR1 event

**Figure 21-5. Power and Brown-Out Assertions versus VDD Levels**

### 21.6.3 VDDC Levels

The  $V_{DDC}$  supply has one monitor: the Power-OK (POK). The POK monitor is used to keep the digital circuitry in reset until the  $V_{DDC}$  power supply is at an acceptable operational level. The digital Power-On Reset (Digital POR) is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges. Figure 21-6 on page 1105 shows the relationship between POK and  $V_{DDC}$ .

**Figure 21-6. POK assertion vs VDDC**

### 21.6.4 VDD Glitches

Figure 21-7 on page 1105 shows the response of the BOR0, BOR1, and the POR circuit to glitches on the  $V_{DD}$  supply.

**Figure 21-7. POR-BOR0-BOR1 VDD Glitch Response**

### 21.6.5 VDD Droop Response

Figure 21-8 on page 1106 shows the response of the BOR0, BOR1, and the POR monitors to a drop on the  $V_{DD}$  supply.

Figure 21-8. POR-BOR0-BOR1 VDD Droop Response

## 21.7 Reset

**Table 21-11. Reset Characteristics**

| Parameter No. | Parameter     | Parameter Name                                                                | Min  | Nom  | Max               | Unit    |
|---------------|---------------|-------------------------------------------------------------------------------|------|------|-------------------|---------|
| R1            | $T_{DPORDLY}$ | Digital POR to Internal Reset assertion delay <sup>a</sup>                    | 0.80 | -    | 5.35              | $\mu$ s |
| R2            | $T_{IRTOUT}$  | Standard Internal Reset time                                                  | -    | 9    | 11.5              | ms      |
|               |               | Internal Reset time with recovery code repair (program or erase) <sup>b</sup> | -    | -    | 6400 <sup>c</sup> | ms      |
| R3            | $T_{BOR0DLY}$ | BOR0 to Internal Reset assertion delay <sup>a</sup>                           | 0.25 | -    | 1.95              | $\mu$ s |
| R3            | $T_{BOR1DLY}$ | BOR1 to Internal Reset assertion delay <sup>a</sup>                           | 0.75 | -    | 5.95              | $\mu$ s |
| R4            | $T_{RSTMIN}$  | Minimum RST pulse width                                                       | -    | 250  | -                 | ns      |
| R5            | $T_{IRHWDLY}$ | RST to Internal Reset assertion delay                                         | -    | 250  | -                 | ns      |
| R6            | $T_{IRSWR}$   | Internal reset timeout after software-initiated system reset                  | -    | 2.07 | -                 | $\mu$ s |
| R7            | $T_{IRWDR}$   | Internal reset timeout after Watchdog reset                                   | -    | 2.10 | -                 | $\mu$ s |
| R8            | $T_{IRMFR}$   | Internal reset timeout after MOSC failure reset                               | -    | 1.92 | -                 | $\mu$ s |

a. Timing values are dependent on the  $V_{DD}$  power-down ramp rate.

b. This parameter applies only in situations where a power-loss or brown-out event occurs during an EEPROM program or erase operation, and EEPROM needs to be repaired (which is a rare case). For all other sequences, there is no impact to normal Power-On Reset (POR) timing. This delay is in addition to other POR delays.

c. This value represents the maximum internal reset time when the EEPROM reaches its endurance limit.

**Figure 21-9. Digital Power-On Reset Timing**

**Note:** The digital Power-On Reset is only released when the analog Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges.

Figure 21-10. Brown-Out Reset Timing

## 21.8 On-Chip Low Drop-Out (LDO) Regulator

**Table 21-12. LDO Regulator Characteristics**

| Parameter    | Parameter Name                                                        | Min  | Nom | Max  | Unit             |
|--------------|-----------------------------------------------------------------------|------|-----|------|------------------|
| $C_{LDO}$    | External filter capacitor size for internal power supply <sup>a</sup> | 2.5  | -   | 4.0  | $\mu\text{F}$    |
| ESR          | Filter capacitor equivalent series resistance                         | 10   | -   | 100  | $\text{m}\Omega$ |
| ESL          | Filter capacitor equivalent series inductance                         | -    | -   | 0.5  | $\text{nH}$      |
| $V_{LDO}$    | LDO output voltage                                                    | 1.08 | 1.2 | 1.32 | V                |
| $I_{INRUSH}$ | Inrush current                                                        | 50   | -   | 250  | $\text{mA}$      |

a. The capacitor should be connected as close as possible to pin 56.

## 21.9 Clocks

The following sections provide specifications on the various clock sources and mode.

### 21.9.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 21-13. Phase Locked Loop (PLL) Characteristics**

| Parameter             | Parameter Name                                                                                                       | Min            | Nom | Max                      | Unit                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------|----------------|-----|--------------------------|-------------------------------|
| F <sub>REF_XTAL</sub> | Crystal reference                                                                                                    | 5 <sup>a</sup> | -   | 25                       | MHz                           |
| F <sub>REF_EXT</sub>  | External clock reference <sup>a</sup>                                                                                | 5 <sup>a</sup> | -   | 25                       | MHz                           |
| F <sub>PLL</sub>      | PLL frequency <sup>b</sup>                                                                                           | -              | 400 | -                        | MHz                           |
| T <sub>READY</sub>    | PLL lock time, enabling the PLL                                                                                      | -              | -   | 512 * (N+1) <sup>c</sup> | reference clocks <sup>d</sup> |
|                       | PLL lock time, changing the XTAL field in the <b>RCC/RCC2</b> register or changing the OSCSRC between MOSC and PIOSC | -              | -   | 128 * (N+1) <sup>c</sup> | reference clocks <sup>d</sup> |

a. If the PLL is not used, the minimum input frequency can be 4 MHz.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register. The PLL frequency that is set by the hardware can be calculated using the values in the **PLLREQ0** and **PLLREQ1** registers.

c. N is the value in the N field in the **PLLREQ1** register.

d. A reference clock is the clock period of the crystal being used, which can be MOSC or PIOSC. For example, a 16-MHz crystal connected to MOSC yields a reference clock of 62.5 ns.

Table 21-14 on page 1111 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 21-14. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | MINT | MFRAC | Q   | N   | PLL Multiplier | PLL Frequency (MHz) | Error   |
|------|-------------------------|------|-------|-----|-----|----------------|---------------------|---------|
| 0x09 | 5.0                     | 0x50 | 0x0   | 0x0 | 0x0 | 80             | 400                 | -       |
| 0x0A | 5.12                    | 0x9C | 0x100 | 0x0 | 0x1 | 156.25         | 400                 | -       |

| 0x15 | 16.0                    | 0x32 | 0x0   | 0x0 | 0x1 | 50             | 400                 | -       |
| 0x16 | 16.384                  | 0xC3 | 0x140 | 0x0 | 0x7 | 195.3125       | 400                 | -       |
| 0x17 | 18                      | 0xC8 | 0x0   | 0x0 | 0x8 | 200            | 400                 | -       |
| 0x18 | 20                      | 0x50 | 0x0   | 0x0 | 0x3 | 80             | 400                 | -       |
| 0x19 | 24                      | 0x32 | 0x0   | 0x0 | 0x2 | 50             | 400                 | -       |

Table 21-14. Actual PLL Frequency (*continued*)

| XTAL | Crystal Frequency (MHz) | MINT | MFRAC | Q   | N   | PLL Multiplier | PLL Frequency (MHz) | Error |
|------|-------------------------|------|-------|-----|-----|----------------|---------------------|-------|
| 0x1A | 25                      | 0x50 | 0x0   | 0x0 | 0x4 | 80             | 400                 | -     |

## 21.9.2 PIOSC Specifications

Table 21-15. PIOSC Clock Characteristics

| Parameter          | Parameter Name                                                                                                                                                      | Min | Nom | Max              | Unit |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|------------------|------|
| F <sub>PIOSC</sub> | Factory calibration:<br>Internal 16-MHz precision oscillator frequency variance across the specified voltage and temperature range when factory calibration is used | -   | -   | ±3%              | -    |
|                    | Recalibration:<br>Internal 16-MHz precision oscillator frequency variance when 7-bit recalibration is used                                                          | -   | -   | ±1% <sup>a</sup> | -    |
| T <sub>START</sub> | PIOSC startup time <sup>b</sup>                                                                                                                                     | -   | -   | 1                | μs   |

a. ±1% is only guaranteed at the specific voltage/temperature condition where the recalibration occurs.

b. PIOSC startup time is part of reset and is included in the internal reset timeout value (T<sub>IRTOU</sub>) given in Table 21-11 on page 1107. Note that the T<sub>START</sub> value is based on simulation.

## 21.9.3 Low-Frequency Internal Oscillator (LFIOSC) Specifications

Table 21-16. Low-Frequency internal Oscillator Characteristics

| Parameter           | Parameter Name                                       | Min | Nom | Max | Unit |
|---------------------|------------------------------------------------------|-----|-----|-----|------|
| F <sub>LFIOSC</sub> | Low-frequency internal oscillator (LFIOSC) frequency | 10  | 33  | 90  | KHz  |

## 21.9.4 Hibernation Clock Source Specifications

Table 21-17. Hibernation Oscillator Input Characteristics

| Parameter                       | Parameter Name                                                                       | Min          | Nom | Max               | Unit |
|---------------------------------|--------------------------------------------------------------------------------------|--------------|-----|-------------------|------|
| F <sub>HIBLFIOSC</sub>          | Hibernation low frequency internal oscillator (HIB LFIOSC) frequency                 | 10           | 33  | 90                | KHz  |
| C <sub>1</sub> , C <sub>2</sub> | External load capacitance on X0SC0, X0SC1 pins <sup>a</sup>                          | 12           | -   | 24                | pF   |
| C <sub>INSE</sub>               | Input capacitance of X0SC0 in single-ended mode                                      | -            | -   | 2                 | pF   |
| C <sub>PKG</sub>                | Device package stray shunt capacitance <sup>a</sup>                                  | -            | 0.5 | -                 | pF   |
| C <sub>PCB</sub>                | PCB stray shunt capacitance <sup>a</sup>                                             | -            | 0.5 | -                 | pF   |
| C <sub>SHUNT</sub>              | Total shunt capacitance <sup>a</sup>                                                 | -            | -   | 4                 | pF   |
| ESR                             | Crystal effective series resistance, OSCDRV = 0 <sup>b</sup>                         | -            | -   | 50                | kΩ   |
|                                 | Crystal effective series resistance, OSCDRV = 1 <sup>b</sup>                         | -            | -   | 75                | kΩ   |
| DL                              | Oscillator output drive level                                                        | -            | -   | 0.25              | μW   |

|                                 | CMOS input high level, when using an external oscillator with 1.8 V ≤ Supply ≤ 3.3 V | 0.8 * Supply | -   | -                 | V    |

**Table 21-17. Hibernation Oscillator Input Characteristics (continued)**

| Parameter                | Parameter Name                                                                                                            | Min | Nom | Max                   | Unit |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|-----|-----|-----------------------|------|
| $V_{IL}^e$               | CMOS input low level, when using an external oscillator with $1.8\text{ V} \leq \text{Supply} \leq 3.63\text{ V}$         | -   | -   | $0.2 * \text{Supply}$ | V    |
| $V_{HYS}^e$              | CMOS input buffer hysteresis, when using an external oscillator with $1.8\text{ V} \leq \text{Supply} \leq 3.63\text{ V}$ | 360 | 960 | 1390                  | mV   |
| DC <sub>HIBOSC_EXT</sub> | External clock reference duty cycle                                                                                       | 30  | -   | 70                    | %    |

a. See information below table.

b. Crystal ESR specified by crystal manufacturer.

c. Oscillator startup time is specified from the time the oscillator is enabled to when it reaches a stable point of oscillation such that the internal clock is valid.

d. Only valid for recommended supply conditions. Measured with OSCDRV bit set (high drive strength enabled, 24 pF).

e. Specification is relative to the larger of  $V_{DD}$  or  $V_{BAT}$ .

The load capacitors added on the board,  $C_1$  and  $C_2$ , should be chosen such that the following equation is satisfied (see Table 21-17 on page 1112 for typical values).

- $C_L$  = load capacitance specified by crystal manufacturer
- $C_L = (C_1 * C_2) / (C_1 + C_2) + C_{PKG} + C_{PCB}$
- $C_{SHUNT} = C_{PKG} + C_{PCB} + C_0$  (total shunt capacitance seen across XOSC0, XOSC1)
- $C_{PKG}$ ,  $C_{PCB}$  as measured across the XOSC0, XOSC1 pins excluding the crystal
- Clear the OSCDRV bit in the **Hibernation Control (HIBCTL)** register for  $C_{1,2} \leq 18\text{ pF}$ ; set the OSCDRV bit for  $C_{1,2} > 18\text{ pF}$ .
- $C_0$  = Shunt capacitance of crystal specified by the crystal manufacturer

## 21.9.5 Main Oscillator Specifications

**Table 21-18. Main Oscillator Input Characteristics**

| Parameter   | Parameter Name                                             | Min             | Nom                | Max      | Unit     |
|-------------|------------------------------------------------------------|-----------------|--------------------|----------|----------|
| $F_{MOSC}$  | Parallel resonance frequency                               | 4 <sup>a</sup>  | -                  | 25       | MHz      |
| $C_1, C_2$  | External load capacitance on OSC0, OSC1 pins <sup>b</sup>  | 10              | -                  | 24       | pF       |
| $C_{PKG}$   | Device package stray shunt capacitance <sup>b</sup>        | -               | 0.5                | -        | pF       |
| $C_{PCB}$   | PCB stray shunt capacitance <sup>b</sup>                   | -               | 0.5                | -        | pF       |
| $C_{SHUNT}$ | Total shunt capacitance <sup>b</sup>                       | -               | -                  | 4        | pF       |
| ESR         | Crystal effective series resistance, 4 MHz <sup>cd</sup>   | -               | -                  | 300      | $\Omega$ |
|             | Crystal effective series resistance, 6 MHz <sup>cd</sup>   | -               | -                  | 200      | $\Omega$ |
|             | Crystal effective series resistance, 8 MHz <sup>cd</sup>   | -               | -                  | 130      | $\Omega$ |
|             | Crystal effective series resistance, 12 MHz <sup>cd</sup>  | -               | -                  | 120      | $\Omega$ |
|             | Crystal effective series resistance, 16 MHz <sup>cd</sup>  | -               | -                  | 100      | $\Omega$ |
|             | Crystal effective series resistance, 25 MHz <sup>cd</sup>  | -               | -                  | 50       | $\Omega$ |
| DL          | Oscillator output drive level <sup>e</sup>                 | -               | OSC <sub>PWR</sub> | -        | mW       |
| $T_{START}$ | Oscillator startup time, when using a crystal <sup>f</sup> | -               | -                  | 18       | ms       |
| $V_{IH}$    | CMOS input high level, when using an external oscillator   | $0.65 * V_{DD}$ | -                  | $V_{DD}$ | V        |

**Table 21-18. Main Oscillator Input Characteristics (continued)**

| Parameter             | Parameter Name                                                  | Min | Nom | Max                    | Unit |
|-----------------------|-----------------------------------------------------------------|-----|-----|------------------------|------|
| V <sub>IL</sub>       | CMOS input low level, when using an external oscillator         | GND | -   | 0.35 * V <sub>DD</sub> | V    |
| V <sub>HYS</sub>      | CMOS input buffer hysteresis, when using an external oscillator | 150 | -   | -                      | mV   |
| DC <sub>OSC_EXT</sub> | External clock reference duty cycle                             | 45  | -   | 55                     | %    |

a. 5 MHz is the minimum when using the PLL.

b. See information below table.

c. Crystal ESR specified by crystal manufacturer.

d. Crystal vendors can be contacted to confirm these specifications are met for a specific crystal part number if the vendors generic crystal datasheet show limits outside of these specifications.

e.  $OSC_{PWR} = (2 * \pi * F_P * C_L * 2.5)^2 * ESR / 2$ . An estimation of the typical power delivered to the crystal is based on the  $C_L$ ,  $F_P$  and ESR parameters of the crystal in the circuit as calculated by the  $OSC_{PWR}$  equation. Ensure that the value calculated for  $OSC_{PWR}$  does not exceed the crystal's drive-level maximum.

f. Oscillator startup time is specified from the time the oscillator is enabled to when it reaches a stable point of oscillation such that the internal clock is valid.

The load capacitors added on the board,  $C_1$  and  $C_2$ , should be chosen such that the following equation is satisfied (see Table 21-18 on page 1113 for typical values and Table 21-19 on page 1115 for detailed crystal parameter information).

- $C_L$  = load capacitance specified by crystal manufacturer
- $C_L = (C_1 * C_2) / (C_1 + C_2) + C_{SHUNT}$
- $C_{SHUNT} = C_0 + C_{PKG} + C_{PCB}$  (total shunt capacitance seen across OSC0, OSC1 crystal inputs)
- $C_{PKG}$ ,  $C_{PCB}$  = the mutual caps as measured across the OSC0, OSC1 pins excluding the crystal.
- $C_0$  = Shunt capacitance of crystal specified by the crystal manufacturer

Table 21-19 on page 1115 lists part numbers of crystals that have been simulated and confirmed to operate within the specifications in Table 21-18 on page 1113. Other crystals that have nearly identical crystal parameters can be expected to work as well.

In the table below, the crystal parameters labeled C0, C1 and L1 are values that are obtained from the crystal manufacturer. These numbers are usually a result of testing a relevant batch of crystals on a network analyzer. The parameters labeled ESR, DL and  $C_L$  are maximum numbers usually available in the data sheet for a crystal.

The table also includes three columns of Recommended Component Values. These values apply to system board components.  $C_1$  and  $C_2$  are the values in pico Farads of the load capacitors that should be put on each leg of the crystal pins to ensure oscillation at the correct frequency.  $R_s$  is the value in k $\Omega$  of a resistor that is placed in series with the crystal between the OSC1 pin and the crystal pin.  $R_s$  dissipates some of the power so the Max DI crystal parameter is not exceeded. Only use the recommended  $C_1$ ,  $C_2$ , and  $R_s$  values with the associated crystal part. The values in the table were used in the simulation to ensure crystal startup and to determine the worst case drive level (WC DI). The value in the WC DI column should not be greater than the Max DI Crystal parameter. The WC DI value can be used to determine if a crystal with similar parameter values but a lower Max DI value is acceptable.

Table 21-19. Crystal Parameters

| MFG      | MFG Part#                    | Holder   | PKG Size<br>(mm x mm) | Freq (MHz) | Crystal Spec<br>(Tolerance /<br>Stability) | Crystal Parameters |         |         |                  |             |                     | Recommended<br>Component<br>Values |                     |                  | WC DI (μW) |

a.  $R_s$  values as low as 0 Ohms can be used. Using a lower  $R_s$  value will result in the WC DL to increase towards the Max DL of the crystal.

b. Although this ESR value is outside of the recommended crystal ESR maximum for this frequency, this crystal has been simulated to confirm proper operation and is valid for use with this device.

c.  $R_s$  values as low as 500 Ohms can be used. Using a lower  $R_s$  value will result in the WC DL to increase towards the Max DL of the crystal.

Table 21-20. Supported MOSC Crystal Frequencies

| Value    | Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |

## 21.9.6 System Clock Specification with ADC Operation

**Table 21-21. System Clock Characteristics with ADC Operation**

| Parameter           | Parameter Name                                                                               | Min     | Nom | Max     | Unit |
|---------------------|----------------------------------------------------------------------------------------------|---------|-----|---------|------|
| F <sub>sysadc</sub> | System clock frequency when the ADC module is operating (when PLL is bypassed). <sup>a</sup> | 15.9952 | 16  | 16.0048 | MHz  |

a. Clock frequency (plus jitter) must be stable inside specified range. ADC can be clocked from the PLL, directly from an external clock source, or from the PIOSC, as long as frequency absolute precision is inside specified range.

## 21.10 Sleep Modes

**Table 21-22. Sleep Modes AC Characteristics<sup>a</sup>**

| Parameter No | Parameter                | Parameter Name                                                                                                         | Min | Nom  | Max                | Unit          |
|--------------|--------------------------|------------------------------------------------------------------------------------------------------------------------|-----|------|--------------------|---------------|
| D1           | T <sub>WAKE_S</sub>      | Time to wake from interrupt in sleep mode <sup>b</sup>                                                                 | -   | -    | 2                  | system clocks |
|              | T <sub>WAKE_DS</sub>     | Time to wake from interrupt in deep-sleep mode, using PIOSC for both Run mode and Deep-sleep mode <sup>b c</sup>       | -   | 1.25 | -                  | μs            |
|              |                          | Time to wake from interrupt in deep-sleep mode, using PIOSC for Run mode and LFIOSC for Deep-sleep mode <sup>b c</sup> | -   | 350  | -                  | μs            |
| D2           | T <sub>WAKE_PLL_DS</sub> | Time to wake from interrupt in deep-sleep mode when using the PLL <sup>b</sup>                                         | -   | -    | T <sub>READY</sub> | ms            |

a. Values in this table assume the LFIOSC is the clock source during sleep or deep-sleep mode.

b. Specified from registering the interrupt to first instruction.

c. If the main oscillator is used for run mode, add the main oscillator startup time, T<sub>START</sub>.

**Table 21-23. Time to Wake with Respect to Low-Power Modes<sup>ab</sup>**

| Mode  | Run Mode Clock/Frequency | Sleep/Deep-Sleep Mode Clock/Frequency | FLASHPM | SRAMP | Time to Wake |        | Unit |
|-------|--------------------------|---------------------------------------|---------|-------|--------------|--------|------|
|       |                          |                                       |         |       | Min          | Max    |      |
| Sleep | MOSC, PLL on - 80MHz     | MOSC, PLL on - 80MHz                  | 0x0     | 0x0   | 0.28         | 0.30   | μs   |
|       |                          |                                       |         | 0x1   | 33.57        | 35.00  | μs   |
|       |                          |                                       |         | 0x3   | 33.75        | 35.05  | μs   |
|       |                          |                                       | 0x2     | 0x0   | 105.02       | 109.23 | μs   |
|       |                          |                                       |         | 0x1   | 137.85       | 143.93 | μs   |
|       |                          |                                       |         | 0x3   | 138.06       | 143.86 | μs   |

Table 21-23. Time to Wake with Respect to Low-Power Modes (*continued*)

| Mode       | Run Mode Clock/Frequency | Sleep/Deep-Sleep Mode Clock/Frequency  | FLASHPM | SRAMP | Time to Wake |        | Unit |
|------------|--------------------------|----------------------------------------|---------|-------|--------------|--------|------|
|            |                          |                                        |         |       | Min          | Max    |      |
| Deep-Sleep | MOSC, PLL on - 80MHz     | PIOSC - 16MHz                          | 0x0     | 0x0   | 2.47         | 2.60   | μs   |
|            |                          |                                        |         | 0x1   | 35.31        | 36.35  | μs   |

|            |                          |                                        | 0x2     | 0x0   | 18.95        | 19.54  | ms   |
|            |                          |                                        |         | 0x1   | 18.94        | 19.53  | ms   |
|            |                          |                                        |         | 0x3   | 18.95        | 19.54  | ms   |

a. Time from wake event to first instruction of code execution.

b. If the LDO voltage is adjusted, it will take an extra 4 us to wake up from Sleep or Deep-sleep mode.

c. PIOSC is turned off by setting the PIOSCPD bit in the **DSLPCCLKCFG** register.

## 21.11 Hibernation Module

The Hibernation module requires special system implementation considerations because it is intended to power down all other sections of its host device, refer to “Hibernation Module” on page 458.

**Table 21-24. Hibernation Module Battery Characteristics**

| Parameter                 | Parameter Name                             | Min | Nominal | Max              | Unit       |
|---------------------------|--------------------------------------------|-----|---------|------------------|------------|
| $V_{BAT}$                 | Battery supply voltage                     | 1.8 | 3.0     | 3.6 <sup>a</sup> | V          |
| $V_{BATRMP}$ <sup>b</sup> | $V_{BAT}$ battery supply voltage ramp time | 0   | -       | 0.7              | V/ $\mu$ s |
| $V_{LOWBAT}$              | Low battery detect voltage, VBATSEL=0x0    | 1.8 | 1.9     | 2.0              | V          |
|                           | Low battery detect voltage, VBATSEL=0x1    | 2.0 | 2.1     | 2.2              | V          |
|                           | Low battery detect voltage, VBATSEL=0x2    | 2.2 | 2.3     | 2.4              | V          |
|                           | Low battery detect voltage, VBATSEL=0x3    | 2.4 | 2.5     | 2.6              | V          |

a. To ensure proper functionality, any voltage input within the range of  $3.6\text{ V} < V_{BAT} \leq 4\text{ V}$  must be connected through a diode.

b. For recommended  $V_{BAT}$  RC circuit values, refer to the diagrams located in “Hibernation Clock Source” on page 461.

**Table 21-25. Hibernation Module AC Characteristics**

| Parameter No | Parameter           | Parameter Name                                                         | Min | Nom                                        | Max | Unit                     |
|--------------|---------------------|------------------------------------------------------------------------|-----|--------------------------------------------|-----|--------------------------|
| H1           | $T_{WAKE}$          | WAKE assertion time                                                    | 100 | -                                          | -   | ns                       |
| H2           | $T_{WAKE\_TO\_HIB}$ | WAKE assert to HIB deassert (wake up time)                             | -   | -                                          | 1   | hibernation clock period |
| H3           | $T_{VDD\_RAMP}$     | $V_{DD}$ ramp to 3.0 V                                                 | -   | Depends on characteristics of power supply | -   | $\mu$ s                  |
| H4           | $T_{VDD\_CODE}$     | $V_{DD}$ at 3.0 V to internal POR deassert; first instruction executes | -   | -                                          | 500 | $\mu$ s                  |

**Figure 21-15. Hibernation Module Timing**

## 21.12 Flash Memory and EEPROM

**Table 21-26. Flash Memory Characteristics**

| Parameter           | Parameter Name                                                    | Min     | Nom | Max  | Unit   |
|---------------------|-------------------------------------------------------------------|---------|-----|------|--------|
| PE <sub>CYC</sub>   | Number of program/erase cycles before failure <sup>a</sup>        | 100,000 | -   | -    | cycles |
| T <sub>RET</sub>    | Data retention, -40°C to +85°C                                    | 20      | -   | -    | years  |
| T <sub>PROG64</sub> | Program time for double-word-aligned 64 bits of data <sup>b</sup> | 30      | 50  | 300  | μs     |
| T <sub>ERASE</sub>  | Page erase time, <1k cycles                                       | -       | 8   | 15   | ms     |
|                     | Page erase time, 10k cycles                                       | -       | 15  | 40   | ms     |
|                     | Page erase time, 100k cycles                                      | -       | 75  | 500  | ms     |
| T <sub>ME</sub>     | Mass erase time, <1k cycles                                       | -       | 10  | 25   | ms     |
|                     | Mass erase time, 10k cycles                                       | -       | 20  | 70   | ms     |
|                     | Mass erase time, 100k cycles                                      | -       | 300 | 2500 | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

b. If programming fewer than 64 bits of data, the programming time is the same. For example, if only 32 bits of data need to be programmed, the other 32 bits are masked off.

**Table 21-27. EEPROM Characteristics<sup>a</sup>**

| Parameter                       | Parameter Name                                                                                                                                     | Min     | Nom | Max  | Unit          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----|------|---------------|
| EPE <sub>CYC</sub> <sup>b</sup> | Number of mass program/erase cycles of a single word before failure <sup>c</sup>                                                                   | 500,000 | -   | -    | cycles        |
| ET <sub>RET</sub>               | Data retention, -40°C to +85°C                                                                                                                     | 20      | -   | -    | years         |
| ET <sub>PROG</sub>              | Program time for 32 bits of data - space available                                                                                                 | -       | 110 | 600  | μs            |
|                                 | Program time for 32 bits of data - requires a copy to the copy buffer, copy buffer has space and less than 10% of EEPROM endurance used            | -       | 30  | -    | ms            |
|                                 | Program time for 32 bits of data - requires a copy to the copy buffer, copy buffer has space and greater than 90% of EEPROM endurance used         | -       | -   | 900  | ms            |

a. Because the EEPROM operates as a background task and does not prevent the CPU from executing from Flash memory, the operation will complete within the maximum time specified provided the EEPROM operation is not stalled by a Flash memory program or erase operation.

b. One word can be written more than 500K times, but these writes impact the endurance of the words in the meta-block that the word is within. Different words can be written such that any or all words can be written more than 500K times when write counts per word stay about the same. See the section called "Endurance" on page 503 for more information.

c. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

## 21.13 Input/Output Pin Characteristics

### 21.13.1 GPIO Module Characteristics

**Note:** All GPIO signals are 5-V tolerant when configured as inputs except for PD4, PD5, PB0 and PB1, which are limited to 3.6 V. See “Signal Description” on page 613 for more information on GPIO configuration.

**Note:** GPIO pads are tolerant to 5-V digital inputs without creating reliability issues, as long as the supply voltage, VDD, is present. There are limitations to how long a 5-V input can be present on any given I/O pad if VDD is not present. Not meeting these conditions will affect reliability of the device and affect the GPIO characteristics specifications.

- If the voltage applied to a GPIO pad is in the high voltage range (5V +/- 10%) while VDD is not present, such condition should be allowed for a maximum of 10,000 hours at 27°C or 5,000 hours at 85°C, over the lifetime of the device.
- If the voltage applied to a GPIO pad is in the normal voltage range (3.3V +/- 10%) while VDD is not present or if the voltage applied is in the high voltage range (5V +/- 10%) while VDD is present, there are no constraints on the lifetime of the device.

**Table 21-28. GPIO Module Characteristics<sup>a</sup>**

| Parameter           | Parameter Name                                                                                                                | Min | Nom  | Max  | Unit |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------|-----|------|------|------|
| C <sub>GPIO</sub>   | GPIO Digital Input Capacitance                                                                                                | -   | 8    | -    | pF   |
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor                                                                                                | 13  | 20   | 30   | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor                                                                                              | 13  | 20   | 35   | kΩ   |

| T <sub>GPIOF</sub>  | GPIO fall time, 2-mA drive <sup>d</sup>                                                                                       | -   | 25.2 | 29.4 | ns   |
|                     | GPIO fall time, 4-mA drive <sup>d</sup>                                                                                       |     | 13.3 | 16.8 | ns   |
|                     | GPIO fall time, 8-mA drive <sup>d</sup>                                                                                       |     | 8.6  | 11.2 | ns   |
|                     | GPIO fall time, 8-mA drive with slew rate control <sup>d</sup>                                                                |     | 11.3 | 12.9 | ns   |

a. V<sub>DD</sub> must be within the range specified in Table 21-5 on page 1097.

b. The leakage current is measured with V<sub>IN</sub> applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pull-up/pull-down resistor is disabled.

c. Time measured from 20% to 80% of V<sub>DD</sub>.

d. Time measured from 80% to 20% of V<sub>DD</sub>.

### 21.13.2 Types of I/O Pins and ESD Protection

With respect to ESD and leakage current, three types of I/O pins exist on the device: Power I/O pins, I/O pins with fail-safe ESD protection (GPIOs other than PD4 and PD5, and XOSC<sub>n</sub> pins) and I/O pins with non-fail-safe ESD protection (any non-power, non-GPIO (other than PD4 and PD5) and

non-XOSCn pins). This section covers I/O pins with fail-safe ESD protection and I/O pins with non-fail-safe ESD protection. Power I/O pin voltage and current limitations are specified in “Recommended Operating Conditions” on page 1097.

### 21.13.2.1 Fail-Safe Pins

GPIOs other than PD4 and PD5, inputs for the Hibernate 32-kHz oscillator (XOSCn), and Hibernate inputs use ESD protection as shown in Figure 21-16 on page 1123.

An unpowered device cannot be parasitically powered through any of these pins. This ESD protection prevents a direct path between these I/O pads and any power supply rails in the device. GPIO/XOSCn pad input voltages should be kept inside the maximum ratings specified in Table 21-1 on page 1095 to ensure current leakage and current injections are within acceptable range. Current leakages and current injection for these pins are specified in Table 21-28 on page 1122.

Figure 21-16 on page 1123 shows a diagram of the ESD protection on fail-safe pins.

Some GPIOs when configured as inputs require a strong pull-up resistor to maintain a threshold above the minimum value of  $V_{IH}$  during power-on. See Table 21-30 on page 1124.

**Figure 21-16. ESD Protection on Fail-Safe Pins**

**Table 21-29. Pad Voltage/Current Characteristics for Fail-Safe Pins<sup>a</sup>**

| Parameter  | Parameter Name                                                | Min | Nom | Max        | Unit    |
|------------|---------------------------------------------------------------|-----|-----|------------|---------|
| $I_{LKG+}$ | GPIO input leakage current, $V_{DD} < V_{IN} \leq 4.5 V^{bb}$ | -   | -   | 700        | $\mu A$ |
|            | GPIO input leakage current, $4.5 V < V_{IN} \leq 5.5 V^{bc}$  | -   | -   | 100        | $\mu A$ |
| $I_{LKG-}$ | GPIO input leakage current, $V_{IN} < -0.3 V^{bd}$            | -   | -   | $-^e$      | $\mu A$ |
|            | GPIO input leakage current, $-0.3 V \leq V_{IN} < 0 V^b$      | -   | -   | 10         | $\mu A$ |
| $I_{INJ+}$ | DC injection current, $V_{DD} < V_{IN} \leq 5.5 V^{fg}$       | -   | -   | $I_{LKG+}$ | $\mu A$ |
| $I_{INJ-}$ | DC injection current, $V_{IN} \leq 0 V^g$                     | -   | -   | 0.5        | mA      |

a.  $V_{IN}$  must be within the range specified in Table 21-1 on page 1095.

b. To protect internal circuitry from over-voltage, the GPIOs have an internal voltage clamp that limits internal swings to  $V_{DD}$  without affecting swing at the I/O pad. This internal clamp starts turning on while  $V_{DD} < V_{IN} < 4.5 V$  and causes a somewhat larger (but bounded) current draw. To save power, static input voltages between  $V_{DD}$  and 4.5 V should be avoided.

c. Leakage current above maximum voltage ( $V_{IN} = 5.5 V$ ) is not guaranteed, this condition is not allowed and can result in permanent damage to the device.

d. Leakage outside the minimum range ( $-0.3 V$ ) is unbounded and must be limited to  $I_{INJ-}$  using an external resistor.

e. In this case,  $I_{LKG-}$  is unbounded and must be limited to  $I_{INJ-}$  using an external resistor.

- f. Current injection is internally bounded for GPIOs, and maximum current into the pin is given by  $I_{LKG+}$  for  $V_{DD} < V_{IN} < 5.5$  V.
- g. If the I/O pad is not voltage limited, it should be current limited (to  $I_{INJ+}$  and  $I_{INJ-}$ ) if there is any possibility of the pad voltage exceeding the VIO limits (including transient behavior during supply ramp up, or at any time when the part is unpowered).

**Table 21-30. Fail-Safe GPIOs that Require an External Pull-up**

| GPIO | Pin | Pull-Up Resistor Value | Unit     |
|------|-----|------------------------|----------|
| PB0  | 45  | $1k \leq R \leq 10k$   | $\Omega$ |
| PB1  | 46  | $1k \leq R \leq 10k$   | $\Omega$ |
| PE3  | 6   | $1k \leq R \leq 10k$   | $\Omega$ |

### 21.13.2.2 Non-Fail-Safe Pins

The Main Oscillator (MOSC) crystal connection pins and GPIO pins PD4 and PD5 have ESD protection as shown in Figure 21-17 on page 1124. These pins have a potential path between the I/O pad and an internal power rail if either one of the ESD diodes is accidentally forward biased. The voltage and current of these pins should follow the specifications in Table 21-31 on page 1124 to prevent potential damage to the device. In addition to the specifications outlined in Table 21-31 on page 1124, it is recommended that the ADC external reference specifications in Table 21-32 on page 1126 be adhered to in order to prevent any gain error.

Figure 21-17 on page 1124 shows a diagram of the ESD protection on non-fail-safe pins.

**Figure 21-17. ESD Protection on Non-Fail-Safe Pins****Table 21-31. Non-Fail-Safe I/O Pad Voltage/Current Characteristics<sup>abcd</sup>**

| Parameter  | Parameter Name                                               | Min  | Nom      | Max          | Unit    |
|------------|--------------------------------------------------------------|------|----------|--------------|---------|
| $V_{IO}$   | IO pad voltage limits                                        | -0.3 | $V_{DD}$ | $V_{DD}+0.3$ | V       |
| $I_{LKG+}$ | Positive IO leakage for $V_{IO} \text{ Max}^{ef}$            | -    | -        | 10           | $\mu A$ |
| $I_{LKG-}$ | Negative IO leakage for $V_{IO} \text{ Min}^{ef}$            | -    | -        | 10           | $\mu A$ |
| $I_{INJ+}$ | Max positive injection <sup>g</sup>                          | -    | -        | 2            | mA      |
| $I_{INJ-}$ | Max negative injection if not voltage protected <sup>g</sup> | -    | -        | -0.5         | mA      |

a.  $V_{IN}$  must be within the range specified in Table 21-1 on page 1095. Leakage current outside of this maximum voltage is not guaranteed and can result in permanent damage of the device.

b.  $V_{DD}$  must be within the range specified in Table 21-5 on page 1097.

- c. To avoid potential damage to the part, either the voltage or current on the ESD-protected, non-Power, non-Hibernate/XOSC input/outputs should be limited externally as shown in this table.
- d. I/O pads should be protected if at any point the IO voltage has a possibility of going outside the limits shown in the table. If the part is unpowered, the IO pad Voltage or Current must be limited (as shown in this table) to avoid powering the part through the IO pad, causing potential irreversible damage.
- e. This value applies to an I/O pin that is voltage-protected within the Min and Max  $V_{IO}$  ratings. Leakage outside the specified voltage range is unbounded and must be limited to  $I_{INJ-}$  using an external resistor.
- f. MIN and MAX leakage current for the case when the I/O is voltage-protected to VIO Min or VIO Max.
- g. If an I/O pin is not voltage-limited, it should be current-limited (to  $I_{INJ+}$  and  $I_{INJ-}$ ) if there is any possibility of the pad voltage exceeding the  $V_{IO}$  limits (including transient behavior during supply ramp up, or at any time when the part is unpowered).

## 21.14 Analog-to-Digital Converter (ADC)

**Table 21-32. ADC Electrical Characteristics<sup>ab</sup>**

| Parameter                                        | Parameter Name                                                                                          | Min               | Nom                      | Max                                                  | Unit       |

| TEMPERATURE SENSOR |                                                                                                         |     |       |     |       |
| V <sub>TSENS</sub> | Temperature sensor voltage, junction temperature 25 °C                                                  | -   | 1.633 | -   | V     |
| S <sub>TSENS</sub> | Temperature sensor slope                                                                                | -   | -13.3 | -   | mV/°C |
| E <sub>TSENS</sub> | Temperature sensor accuracy <sup>v</sup>                                                                | -   | -     | ±5  | °C    |

- a. V<sub>REF+</sub> = 3.3V, F<sub>ADC</sub> = 16 MHz unless otherwise noted.
- b. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk. Analog signals configured adjacent to ADC input channels should meet the same source resistance and bandwidth limitations that apply to the ADC input signals.
- c. Two capacitors in parallel.
- d. Internal reference is connected directly between V<sub>DDA</sub> and GNDA (VREFi = V<sub>DDA</sub> - GNDA). In this mode, E<sub>O</sub>, E<sub>G</sub>, E<sub>T</sub>, and dynamic specifications are adversely affected due to internal voltage drop and noise on V<sub>DDA</sub> and GNDA.
- e. V<sub>ADCIN</sub> = V<sub>INP</sub> - V<sub>INN</sub>
- f. With signal common mode as V<sub>DDA</sub>/2.
- g. This parameter is defined as the average of the differential inputs.
- h. As shown in Figure 21-18 on page 1128, R<sub>ADC</sub> is the total equivalent resistance in the input line all the way up to the sampling node at the input of the ADC.
- i. See "System Clock Specification with ADC Operation" on page 1117 for full ADC clock frequency specification.
- j. ADC conversion time (T<sub>c</sub>) includes the ADC sample time (T<sub>s</sub>).
- k. 12-bit DNL
- l. Gain error is measured at max code after compensating for offset. Gain error is equivalent to "Full Scale Error." It can be given in % of slope error, or in LSB, as done here.
- m. Total Unadjusted Error is the maximum error at any one code versus the ideal ADC curve. It includes all other errors (offset error, gain error and INL) at any given ADC code.
- n. A low-noise environment is assumed in order to obtain values close to spec. The board must have good ground isolation between analog and digital grounds and a clean reference voltage. The input signal must be band-limited to Nyquist bandwidth. No anti-aliasing filter is provided internally.
- o. ADC dynamic characteristics are measured using low-noise board design, with low-noise reference voltage (< -74dB noise level in signal BW) and low-noise analog supply voltage. Board noise and ground bouncing couple into the ADC and affect dynamic characteristics. Clean external reference must be used to achieve shown specs.
- p. Differential signal with correct common mode, applied between two ADC inputs.
- q. SDR = -THD in dB.
- r. For higher frequency inputs, degradation in SDR should be expected.
- s. SNDR = S/(N+D) = SINAD (in dB)
- t. Effective number of bits (ENOB) can be calculated from SNDR: ENOB = (SNDR - 1.76) / 6.02.
- u. Single-ended inputs are more sensitive to board and trace noise than differential inputs; SNR and SNDR measurements on single-ended inputs are highly dependent on how clean the test set-up is. If the input signal is not well-isolated on the board, higher noise than specified could potentially be seen at the ADC output.
- v. Note that this parameter does not include ADC error.

| S13           | $T_{RXDSH}$     | Slave Mode: Rx Data In (from master) hold time                                  | 51.55 <sup>f</sup> | -   | -                  | ns   |

a. In master mode, the system clock must be at least twice as fast as the SSIClk.

b. In slave mode, the system clock must be at least 12 times faster than the SSIClk.

c. Note that the delays shown are using 8-mA drive strength.

d. This MAX value is for the minimum  $T_{SYSCLK}$  (12.5 ns). To find the MAX  $T_{TXDSOV}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 * T_{SYSCLK} + 27.74$ .

e. This MIN value is for the minimum slave mode  $T_{SYSCLK}$  (12.5 ns). To find the MIN  $T_{TXDSOH}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 * T_{SYSCLK} + 5.50$ .

f. This MIN value is for the minimum slave mode  $T_{SYSCLK}$  (12.5 ns). To find the MIN  $T_{RXDSH}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 * T_{SYSCLK} + 1.55$ .

| I5 <sup>c</sup> | T <sub>SFT</sub>  | I2CSCL/I2CSDA fall time (V <sub>IH</sub> = 2.4 V to V <sub>IL</sub> = 0.5 V) | -   | 9                   | 10           | ns            |
| I6 <sup>a</sup> | T <sub>HT</sub>   | Clock High time                                                              | 24  | -                   | -            | system clocks |
| I7              | T <sub>DS</sub>   | Data setup time                                                              | 18  | -                   | -            | system clocks |
| I8 <sup>a</sup> | T <sub>SCSR</sub> | Start condition setup time (for repeated start condition only)               | 36  | -                   | -            | system clocks |
| I9 <sup>a</sup> | T <sub>SCS</sub>  | Stop condition setup time                                                    | 24  | -                   | -            | system clocks |
| I10             | T <sub>DV</sub>   | Data Valid (slave)                                                           | -   | 2                   | -            | system clocks |
|                 |                   | Data Valid (master)                                                          | -   | (6 * (1 + TPR)) + 1 | -            | system clocks |

- a. Values depend on the value programmed into the TPR bit in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.
- b. Because I2CSCL and I2CSDA operate as open-drain-type signals, which the controller can only actively drive Low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.
- c. Specified at a nominal 50 pF load.

Figure 21-23. I<sup>2</sup>C Timing

## 21.17 Analog Comparator

**Table 21-35. Analog Comparator Characteristics<sup>ab</sup>**

| Parameter            | Parameter Name                                | Min  | Nom      | Max        | Unit    |
|----------------------|-----------------------------------------------|------|----------|------------|---------|
| $V_{INP}, V_{INN}^c$ | Input voltage range                           | GNDA | -        | $V_{DDA}$  | V       |
| $V_{CM}$             | Input common mode voltage range               | GNDA | -        | $V_{DDA}$  | V       |
| $V_{OS}$             | Input offset voltage                          | -    | $\pm 10$ | $\pm 50^d$ | mV      |
| $I_{INP}, I_{INN}$   | Input leakage current over full voltage range | -    | -        | 2.0        | $\mu A$ |
| $C_{MRR}$            | Common mode rejection ratio                   | -    | 50       | -          | dB      |
| $T_{RT}$             | Response time                                 | -    | -        | $1.0^e$    | $\mu s$ |
| $T_{MC}$             | Comparator mode change to Output Valid        | -    | -        | 10         | $\mu s$ |

a. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk.

b. To achieve best analog results, the source resistance driving the analog inputs,  $V_{INP}$  and  $V_{INN}$ , should be kept low.

c. The external voltage inputs to the Analog Comparator are designed to be highly sensitive and can be affected by external noise on the board. For this reason,  $V_{INP}$  and  $V_{INN}$  must be set to different voltage levels during idle states to ensure the analog comparator triggers are not enabled. If an internal voltage reference is used, it should be set to a mid-supply level. When operating in Sleep/Deep-Sleep modes, the Analog Comparator module external voltage inputs set to different levels (greater than the input offset voltage) to achieve minimum current draw.

d. Measured at  $V_{REF}=100$  mV.

e. Measured at external  $V_{REF}=100$  mV, input signal switching from 75 mV to 125 mV.

**Table 21-36. Analog Comparator Voltage Reference Characteristics**

| Parameter | Parameter Name               | Min | Nom             | Max            | Unit |
|-----------|------------------------------|-----|-----------------|----------------|------|
| $R_{HR}$  | Resolution in high range     | -   | $V_{DDA}/29.4$  | -              | V    |
| $R_{LR}$  | Resolution in low range      | -   | $V_{DDA}/22.12$ | -              | V    |
| $A_{HR}$  | Absolute accuracy high range | -   | -               | $\pm R_{HR}/2$ | V    |
| $A_{LR}$  | Absolute accuracy low range  | -   | -               | $\pm R_{LR}/2$ | V    |

|                           |                                              | V <sub>DD</sub> = 3.3 V  |              |              |       |      |      |      |      |
|                           |                                              | V <sub>DDA</sub> = 3.3 V |              |              |       |      |      |      |      |
|                           |                                              | System Clock = OFF       |              |              |       |      |      |      |      |

a. The value for I<sub>DDA</sub> is included in the above values for I<sub>DD\_RUN</sub>, I<sub>DD\_SLEEP</sub>, and I<sub>DD\_DEEPSLEEP</sub>.

b. Note that if the MOSC is the source of the Run-mode system clock and is powered down in Sleep mode, wake time is increased by T<sub>MOSC\_SETTLE</sub>.

## A Package Information

### A.1 Orderable Devices

The figure below defines the full set of orderable part numbers for the TM4C123x Series. See the Package Option Addendum for the complete list of valid orderable part numbers for the TM4C1231E6PM microcontroller.

**Figure A-1. Key to Part Numbers**

### A.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microcontroller (MCU) devices. Each Tiva™ C Series family member has one of two prefixes: XM4C or TM4C. These prefixes represent evolutionary stages of product development from engineering prototypes (XM4C) through fully qualified production devices (TM4C).

Device development evolutionary flow:

- XM4C — Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- TM4C — Production version of the silicon die that is fully qualified.

XM4C devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TM4C devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XM4C) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

## A.3 Device Markings

The figure below shows an example of the Tiva™ microcontroller package symbolization.

This identifying number contains the following information:

- **Lines 1 and 5:** Internal tracking numbers
- **Lines 2 and 3:** Part number

For example, TM4C123G on the second line followed by H6PGEI7 on the third line indicates orderable part number TM4C123GH6PGEI7. The silicon revision number is the last number in the part number, in this example, 7. The **DIDO** register also identifies the version of the microcontroller, as shown in the table below. Combined, the MAJOR and MINOR bit fields indicate the die revision and part revision numbers.

| MAJOR Bitfield Value | MINOR Bitfield Value | Die Revision | Part Revision |
|----------------------|----------------------|--------------|---------------|
| 0x0                  | 0x0                  | A0           | 1             |
| 0x0                  | 0x1                  | A1           | 2             |
| 0x0                  | 0x2                  | A2           | 3             |
| 0x0                  | 0x3                  | A3           | 4             |
| 0x1                  | 0x0                  | B0           | 5             |
| 0x1                  | 0x1                  | B1           | 6             |
| 0x1                  | 0x2                  | B2           | 7             |

- **Line 4:** Date code

The first two characters on the fourth line indicate the date code, followed by internal tracking numbers. The two-digit date code YM indicates the last digit of the year, then the month. For example, a 34 for the first two digits of the fourth line indicates a date code of April 2013.

## A.4 Packaging Diagram

Figure A-2. TM4C1231E6PM 64-Pin LQFP Package Diagram

### MECHANICAL DATA

MTQF008A – JANUARY 1995 – REVISED DECEMBER 1996

PM (S-PQFP-G64)

PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Falls within JEDEC MS-026
  - D. May also be thermally enhanced plastic with leads connected to the die pads.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

4215162/A 03/2017

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MS-026.

# EXAMPLE STENCIL DESIGN

PM0064A

LQFP - 1.6 mm max height

PLASTIC QUAD FLATPACK

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:8X

4215162/A 03/2017

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](#) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
