

Evaluation Board Manual

- LED Driver for common cathode parallel connected LEDs
- Ultra Low Dropout Voltage of 200mV
- No EMI, no switching noise
- Integrated current matching
- PWM and Analog brightness control
- Enable/Shutdown control
- Shutdown current < 1 μ A
- Small footprint SOT23-6 Package

DESCRIPTION

The SP7121 driver provides a simple solution for a matched current source for any color common cathode LEDs. The common cathode connection allows the user to increase the led power dissipation by having the cathodes heat sunk to the ground plane of the circuit board. The SP7121 output current value is set by external resistor. At shutdown mode (EN pin is LOW) the supply current drops to .04 μ A typical. The SP7121 driver is available in a small footprint 6-pin SOT23-6 package.

BOARD SCHEMATIC

Figure 1 SP7121 Powering 2 LEDs

1) Powering Up the SP7121

The Evaluation Board can be powered from inputs ranging from 2.7 to 5.5V_{in}. All that is required is to populate the LED location with desired LED and connect the source voltage to VCC and GND. There is a jumper located on the PCB. The jumper needs to be set between center pin and VCC (Enable logic high) to activate the part. If the jumper is left unpopulated the driver will be off due to the pull down resistor on the enable pin

Setting the Current in the SP7121

Current amplifier provides current gain function where the R2 resistor is connected from the Iset pin (pin 4) to GND. The current, produced by the R2 resistor is then amplified and delivered to the LED output. The external R2 resistor value for SP7121 is determined by following equation:

$$R2 = 205 \times V_{set}/I_{LED}$$

Where I_{LED} = required LED current value in mA per channel.

V_{set} = 1.22V

205 is the typical gain

The LED current level can be set anywhere from 10mA to 25mA per each output to be guaranteed by specification table. For currents above 25mA up to 30mA specifications are not guaranteed by the specification table but the part will operate without damage.

The SP7121 does not have protection from ISET pin being shorted to ground or R2 value being too low. With an operational maximum current of 30mA per channel device may be damaged if ISET pin is shorted to the ground or R2 value is below 8k.

For typical test results please refer to the data sheet.
