

# SN54LS137, SN74LS137 3-LINE TO 8-LINE DECODERS/DEMULTIPLEXERS WITH ADDRESS LATCHES

SDLS132 - JUNE 1978 - REVISED MARCH 1988

- Combines Decoder and 3-Bit Address Latch
- Incorporates 2 Enable Inputs to Simplify Cascading
- Low Power Dissipation . . . 65 mW Typ

## description

The 'LS137 is a three-line to eight-line decoder/demultiplexer with latches on the three address inputs. When the latch-enable input ( $\overline{GL}$ ) is low, the 'LS137 acts as a decoder/demultiplexer. When  $\overline{GL}$  goes from low to high, the address present at the select inputs (A, B, and C) is stored in the latches. Further address changes are ignored as long as  $\overline{GL}$  remains high. The output enable controls, G1 and  $\overline{G2}$ , control the state of the outputs independently of the select or latch-enable inputs. All of the outputs are high unless G1 is high and  $\overline{G2}$  is low. The 'LS137 is ideally suited for implementing glitch-free decoders in strobed (stored-address) applications in bus-oriented systems.
