

TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON GATE CMOS

524,288 WORDS × 8 BIT STATIC RAM

DESCRIPTION

The TC554001FI/FTI is a 4,194,304-bit static random access memory (SRAM) organized as 524,288 words by 8 bits. Fabricated using Toshiba's CMOS Silicon gate process technology, this device operates from a single $5V \pm 10\%$ power supply. Advanced circuit technology provides both high speed and low power at an operating current of 10mA/MHz(typ) and minimum cycle time of 85 ns. It is automatically placed in low-power mode at $140 \mu A$ standby current (max) when chip enable (CE) is asserted high. There are two control inputs. CE is used to select the device and for data retention control, and output enable (OE) provides fast memory access. This device is well suited to various microprocessor system applications where high speed, low power and battery backup are required. And, with a guaranteed operating range of -40 to $85^\circ C$, the TC554001FI/FTI can be used in environments exhibiting extreme temperature conditions. The TC554001FI/FTI is available in a standard plastic 32-pin small-outline package(SOP) and 32-pin thin-small-outline package(TSOP).

FEATURES

- Low-power dissipation
Operating: 55 mW/MHz (typical)
- Standby current of $8 \mu A$ (maximum) at $T_a = 25^\circ C$
- Single power supply voltage of $5V \pm 10\%$
- Power down features using CE
- Data retention supply voltage of 2.0 to 5.5 V
- Directly TTL compatibility for all inputs and outputs
- Wide operating temperature range of -40° to $85^\circ C$

- Access Time (maximum)

	TC551001FI/FTI	
	-85L	-10L
Access Time	85 ns	100 ns
CE Access Time	85 ns	100 ns
OE Access Time	45 ns	50 ns

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

READ CYCLE (See Note 1)

WRITE CYCLE 1 (R/W CONTROLLED) (See Note 4)

WRITE CYCLE 2 ($\overline{CE}$ CONTROLLED) (See Note 4)

- (1) R/W remains High for Read Cycle.
- (2) If $\overline{CE}$ goes coincident with or after R/W goes LOW, the output will remain at high impedance.
- (3) If $\overline{CE}$ goes HIGH coincident with or before R/W goes HIGH, the output will remain at high impedance.
- (4) IF $\overline{CE}$ is HIGH during the write cycle, the outputs will remain at high impedance.
- (5) Because I/O signals may be in the output state at this time, input signals of reverse polarity must not be applied.
