

4 Mbit (256K x 18) Flow Through Sync SRAM

Features

- 256K x 18 common I/O
- 3.3V Core Power Supply (V_{DD})
- 2.5V or 3.3V I/O Power Supply (V_{DDQ})
- Fast Clock-to-output times
- 6.5 ns (133 MHz version)
- Provide high performance 2-1-1-1 Access Rate
- User selectable Burst Counter supporting Intel Pentium interleaved or Linear Burst Sequences
- Separate Processor and Controller Address Strobes
- Synchronous Self Timed Write
- Asynchronous output enable
- Available in Pb-Free 100-Pin TQFP package, Pb-Free and non-Pb-Free 119-Ball BGA Package
- "ZZ" Sleep Mode option

Functional Description

The CY7C1325G^[1] is a 256K x 18 synchronous cache RAM designed to interface with high speed microprocessors with minimum glue logic. Maximum access delay from clock rise is 6.5 ns (133 MHz version). A 2 bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access. All synchronous inputs are gated by registers controlled by a positive-edge-triggered Clock Input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining Chip Enable ($\overline{CE}_1$), depth-expansion Chip Enables ($\overline{CE}_2$ and $\overline{CE}_3$), Burst Control inputs (ADSC, ADSP, and ADV), Write Enables ($BW_{[A:B]}$ and BWE), and Global Write (GW). Asynchronous inputs include the Output Enable ($\overline{OE}$) and the ZZ pin.

The CY7C1325G allows either interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence, while a LOW selects a linear burst sequence. Burst accesses can be initiated with the Processor Address Strobe (ADSP) or the cache Controller Address Strobe (ADSC) inputs.

Addresses and chip enables are registered at rising edge of clock when either Address Strobe Processor (ADSP) or Address Strobe Controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the Advance pin (ADV).

The CY7C1325G operates from a +3.3V core power supply while all outputs may operate with either a +2.5 or +3.3V supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible

Pin Definitions

Name	I/O	Description
A0, A1, A	Input-Synchronous	Address Inputs Used to Select One of the 256K Address Locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and CE ₁ , CE ₂ , and CE ₃ are sampled active. A _[1:0] feed the 2 bit counter.
BW _A , BW _B	Input-Synchronous	Byte Write Select Inputs, Active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
GW	Input-Synchronous	Global Write Enable Input, Active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (ALL bytes are written, regardless of the values on BW _[A:B] and BWE).
BWE	Input-Synchronous	Byte Write Enable Input, Active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
CLK	Input-Clock	Clock Input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation.
CE ₁	Input-Synchronous	Chip Enable 1 Input, Active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₂ and CE ₃ to select/deselect the device. ADSP is ignored if CE ₁ is HIGH. CE ₁ is sampled only when a new external address is loaded.
CE ₂	Input-Synchronous	Chip Enable 2 Input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₃ to select/deselect the device. CE ₂ is sampled only when a new external address is loaded.
CE ₃	Input-Synchronous	Chip Enable 3 Input, Active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₂ to select/deselect the device. CE ₃ is sampled only when a new external address is loaded.
OE	Input-Asynchronous	Output Enable, Asynchronous Input, Active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.

Pin Definitions (continued)

Name	I/O	Description
ADV	Input-Synchronous	Advance Input signal, Sampled on the Rising Edge of CLK. When asserted, it automatically increments the address in a burst cycle.
ADSP	Input-Synchronous	Address Strobe from Processor, Sampled on the Rising Edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when CE_1 is deasserted HIGH.
ADSC	Input-Synchronous	Address Strobe from Controller, Sampled on the Rising Edge of CLK, Active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.
ZZ	Input-Asynchronous	ZZ “Sleep” Input, Active HIGH. When asserted HIGH places the device in a non-time-critical “sleep” condition with data integrity preserved. During normal operation, this pin has to be low or left floating. ZZ pin has an internal pull down.
DQs DQP _A , DQP _B	I/O-Synchronous	Bidirectional Data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQs and DQP _[A:B] are placed in a tristate condition.
V _{DD}	Power Supply	Power Supply Inputs to the Core of the Device.
V _{SS}	Ground	Ground for the Core of the Device.
V _{DDQ}	I/O Power Supply	Power Supply for the I/O Circuitry.
MODE	Input-Static	Selects Burst Order. When tied to GND selects linear burst sequence. When tied to V _{DD} or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode Pin has an internal pull up.
NC		No Connects. Not Internally connected to the die.
NC/9M, NC/18M NC/36M NC/72M, NC/144M, NC/288M, NC/576M, NC/1G	–	No Connects. Not internally connected to the die. NC/9M, NC/18M, NC/36M, NC/72M, NC/144M, NC/288M, NC/576M and NC/1G are address expansion pins that are not internally connected to the die.

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CDV}) is 6.5 ns (133 MHz device).

The CY7C1325G supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486 processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user-selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the Processor Address Strobe (ADSP) or the Controller Address Strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the Byte Write Enable (BWE) and Byte Write Select ($BW_{[A:B]}$) inputs. A Global Write Enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self timed write circuitry.

Three synchronous Chip Selects ($\overline{CE}_1$, CE_2 , $\overline{CE}_3$) and an asynchronous Output Enable (OE) provide for easy bank selection and output tristate control. ADSP is ignored if CE_1 is HIGH.

Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2 , and $\overline{CE}_3$ are all asserted active, and (2) ADSP or ADSC is asserted LOW (if the access is initiated by ADSC, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter/control logic and presented to the memory core. If the OE input is asserted LOW, the requested data is available at the data outputs, a maximum to t_{CDV} after clock rise. ADSP is ignored if CE_1 is HIGH.

Single Write Accesses Initiated by ADSP

This access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2 , $\overline{CE}_3$ are all asserted active, and (2) ADSP is asserted LOW. The addresses presented are loaded into the address register and the burst inputs (GW, BWE, and $BW_{[A:B]}$) are ignored during this first clock cycle. If the write inputs are asserted active (see Write Cycle Descriptions table for appropriate states that indicate a write) on the next clock rise, the

appropriate data is latched and written into the device. Byte writes are allowed. During byte writes, BW_A controls DQ_A and BW_B controls DQ_B . All I/Os are tristated during a byte write. Since this is a common I/O device, the asynchronous OE input signal must be deasserted and the I/Os must be tristated prior to the presentation of data to DQ_S . As a safety precaution, the data lines are tristated after a write cycle is detected, regardless of the state of OE.

Single Write Accesses Initiated by ADSC

This write access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2 , and $\overline{CE}_3$ are all asserted active, (2) ADSC is asserted LOW, (3) ADSP is deasserted HIGH, and (4) the write input signals (GW, BWE, and $BW_{[A:B]}$) indicate a write access. ADSC is ignored if ADSP is active LOW.

The addresses presented are loaded into the address register and the burst counter/control logic and delivered to the memory core. The information presented to $DQ_{[A:D]}$ is written into the specified address location. Byte writes are allowed. During byte writes, BW_A controls DQ_A , BW_B controls DQ_B . All I/Os are tristated when a write is detected, even a byte write. Since this is a common I/O device, the asynchronous OE input signal must be deasserted and the I/Os must be tristated prior to the presentation of data to DQ_S . As a safety precaution, the data lines are tristated after a write cycle is detected, regardless of the state of OE.

Burst Sequences

The CY7C1325G provides an on-chip two bit wraparound burst counter inside the SRAM. The burst counter is fed by $A_{[1:0]}$, and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE selects a linear burst sequence. A HIGH on MODE selects an interleaved burst order. Leaving MODE unconnected causes the device to default to a interleaved burst sequence.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. $\overline{CE}_S$, ADSP, and ADSC must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

Interleaved Burst Address Table (MODE = Floating or V_{DD})

First Address A ₁ , A ₀	Second Address A ₁ , A ₀	Third Address A ₁ , A ₀	Fourth Address A ₁ , A ₀

Truth Table for Read/Write

The Truth Table for Read/Write for part CY7C1325G is as follows. [2]

Function	$\overline{GW}$	$\overline{BWE}$	$\overline{BW}_B$	$\overline{BW}_A$
Read	H	H	X	X
Read	H	L	H	H
Write Byte A – (DQ_A and DQP_A)	H	L	H	L
Write Byte B – (DQ_B and DQP_B)	H	L	L	H
Write All Bytes	H	L	L	L
Write All Bytes	L	X	X	X

Notes

- X = "Don't Care." H = Logic HIGH, L = Logic LOW.
- $\overline{WRITE} = L$ when any one or more Byte Write enable signals ($\overline{BW}_A$, $\overline{BW}_B$) and $\overline{BWE} = L$ or $\overline{GW} = L$. $\overline{WRITE} = H$ when all Byte write enable signals ($\overline{BW}_A$, $\overline{BW}_B$), $\overline{BWE}$, $\overline{GW} = H$.
- The DQ pins are controlled by the current cycle and the $\overline{OE}$ signal. $\overline{OE}$ is asynchronous and is not sampled with the clock.
- The SRAM always initiates a read cycle when ADSP is asserted, regardless of the state of $\overline{GW}$, $\overline{BWE}$, or $\overline{BW}_{[A:B]}$. Writes may occur only on subsequent clocks after the ADSP or with the assertion of ADSC. As a result, $\overline{OE}$ must be driven HIGH prior to the start of the write cycle to allow the outputs to tristate. $\overline{OE}$ is a don't care for the remainder of the write cycle.
- $\overline{OE}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tristate when $\overline{OE}$ is inactive or when the device is deselected, and all data bits behave as output when $\overline{OE}$ is active (LOW).

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage Temperature –65°C to +150°C

Ambient Temperature with

Notes

10. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above V_{DD}(minimum) initially before a read or write operation can be initiated.
11. t_{CHZ}, t_{CLZ}, t_{OE_{LZ}}, and t_{OE_{HZ}} are specified with AC test conditions shown in part (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
12. At any voltage and temperature, t_{OE_{HZ}} is less than t_{OE_{LZ}} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High Z prior to Low Z under the same system conditions.
13. This parameter is sampled and not 100% tested.
14. Timing reference level is 1.5V when V_{DDQ} = 3.3V and is 1.25V when V_{DDQ} = 2.5V.
15. Test conditions shown in (a) of AC Test Loads unless otherwise noted.

Timing Diagrams

Figure 4. Read Cycle Timing^[16]

Note

16. On this diagram, when $\overline{CE}$ is LOW: $\overline{CE}_1$ is LOW, $\overline{CE}_2$ is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH: $\overline{CE}_1$ is HIGH or $\overline{CE}_2$ is LOW or $\overline{CE}_3$ is HIGH.

Timing Diagrams (continued)

Figure 5. Write Cycle Timing^[16, 17]

Note

17. Full width write can be initiated by either $\overline{GW}$ LOW; or by $\overline{GW}$ HIGH, $\overline{BWE}$ LOW and $\overline{BW}_{[A:B]}$ LOW.

Timing Diagrams (continued)

Figure 6. Read/Write Timing^[16, 18, 19]

Notes

18. The data bus (Q) remains in High Z following a WRITE cycle, unless a new read access is initiated by $\overline{\text{ADSP}}$ or $\overline{\text{ADSC}}$.
 19. GW is HIGH.

Timing Diagrams (continued)

Figure 7. ZZ Mode Timing^[20, 21]

Notes

20. Device must be deselected when entering ZZ mode. See Cycle Descriptions table for all possible signal conditions to deselect the device.
 21. DQs are in High Z when exiting ZZ sleep mode.

Ordering Information

The table below contains only the parts that are currently available. If you don't see what you are looking for, please contact your local sales representative. For more information, visit the Cypress website at www.cypress.com and refer to the product summary page at <http://www.cypress.com/products>

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at <http://www.cypress.com/go/datasheet/offices>

Table 1. Ordering Information

Speed (MHz)	Ordering Code	Package Diagram	Part and Package Type	Operating Range
133	CY7C1325G-133AXC	51-85050	100-Pin Thin Quad Flat Pack (14 x 20 x 1.4 mm) Pb-Free	Commercial
	CY7C1325G-133BGC	51-85115	119-ball Ball Grid Array (14 x 22 x 2.4 mm)	
100	CY7C1325G-100AXC	51-85050	100-Pin Thin Quad Flat Pack (14 x 20 x 1.4 mm) Pb-Free	Commercial
	CY7C1325G-100AXI	51-85050	100-Pin Thin Quad Flat Pack (14 x 20 x 1.4 mm) Pb-Free	Industrial

Document History Page

Document Title: CY7C1325G, 4 Mbit (256K x 18) Flow Through Sync SRAM Document Number: 38-05518				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	224366	RKF	See ECN	New datasheet
*A	283775	VBL	See ECN	Deleted 66 MHz Changed TQFP package to Pb-Free TQFP in Ordering Information section Added BG Pb-Free package
*B	333626	SYT	See ECN	Removed 117 MHz speed bin Modified Address Expansion balls in the pinouts for 100 TQFP and 119 BGA Packages as per JEDEC standards and updated the Pin Definitions accordingly Modified V_{OL} , V_{OH} test conditions Replaced 'Snooze' with 'Sleep' Replaced TBD's for Θ_{JA} and Θ_{JC} to their respective values on the Thermal Resistance table Changed the package name for 100 TQFP from A100RA to A101 Removed comment on the availability of BG Pb-Free package Updated the Ordering Information by shading and unshading MPNs as per availability
*C	418633	RXU	See ECN	Converted From Preliminary to Final Changed address of Cypress Semiconductor Corporation on Page# 1 from "3901 North First Street" to "198 Champion Court" Modified test condition in Footnote from $V_{DDQ} < V_{DD}$ to $V_{DDQ} \leq V_{DD}$ Modified "Input Load" to "Input Leakage Current except ZZ and MODE" in the Electrical Characteristics Table. Replaced Package Name column with Package Diagram in the Ordering Information table Replaced Package Diagram of 51-85050 from *A to *B Updated the Ordering Information
*D	480124	VKN	See ECN	Added the Maximum Rating for Supply Voltage on V_{DDQ} Relative to GND. Updated the Ordering Information table.
*E	2756998	VKN	08/28/09	Included Soft Error Immunity Data Modified Ordering Information table by including parts that are available and modified the disclaimer for the Ordering information.
