Full safety chain:

Since a perfect safety system does not exist, the latest standards relating to functional safety and voluntary application provide new risk management methods to be used from the design stage by applying principles such as the safety integrity level (SIL) as well as extensively using established operating safety concepts.

*Covering also the non-electrical technologies?e.g. hydraulics...

Risk reduction according to EN IEC 61508

- **Safety** is achieved by risk reduction (for those hazards that cannot be designed-out).
- **Residual risk** is the risk remaining after protective measures have been taken.
- **Protective measures** realised by E/E/PE safety related systems contribute to risk reduction.

For machinery, the probability of dangerous failures per hour of a control system is denoted in EN IEC 62061 as the PFHD

- The rate of failures λ can be expressed as follows:

$$\lambda = \lambda_s + \lambda_{dd} + \lambda_{du}$$

- The calculation of the PFHD for a system or subsystem depends on several parameters:

- the dangerous failure rate (λ_d) of the subsystem elements
- the fault tolerance (e.g. redundancy) of the system
- the diagnostic test interval (T2)
- the proof test interval (T1) or lifetime whichever is smaller
- the susceptibility to common cause failures (β)

- For each of the four different logical architectures A to D there is a different formula to calculate the PFHD. (see EN IEC 62061)
(The principal relationship is: $\text{PFHD} = \lambda_d \times 1h$)

λ_s = rate of safe failures,
 λ_{dd} = rate of detected dangerous failures,
 λ_{du} = rate of undetected dangerous failures

In practice, detected dangerous failure are dealt with by fault reaction functions

Safety integrity level SIL	High demand or continuous mode of operation (Probability of a dangerous failure per hour) PFHD
3	10^{-8} to $< 10^{-7}$
2	10^{-7} to $< 10^{-6}$
1	10^{-6} to $< 10^{-5}$

Safety of Machinery: *EN ISO 13849-1, definition of $MTTF_d$

■ The parameter for the failure rate in EN ISO 13849-1 is the Mean Time To Failure (MTTF). This time value indicates the number of years in which the first failure probably occurs.

- **MTTF = mean time to failure** [years]
 - The mean time after installation of devices to any first failure.
 - The general relation between λ and MTTF is:

$$MTTF = 1/\lambda$$

- **MTBF = mean time between failures**
 - Not relevant for devices which are not repaired.
- **$MTTF_d$ = mean time to dangerous failure**
 - The $MTTF_d$ is defined in EN ISO 13849-1 as the expectation of the mean time to dangerous failure of a safety related part of a control system.

* In several application the realisation of performance level c by category 1 may not be sufficient. In this case a higher category e.g. 2 or 3 should be chosen.

Safety of Machinery: *EN ISO 13849-1 Risk graph and parameters

S = Severity of injury

S1 = Slight (normally reversible injury)
S2 = Serious (normally irreversible) injury including death

F = Frequency and/or exposure time to the hazard

F1 = Seldom to less often and/or the exposure time is short
F2 = Frequent to continuous and/or the exposure time is long

P = Possibility of avoiding the hazard or limiting the harm

P1 = Possible under specific conditions
P2 = Scarcely possible
