10-MHz TO 40-MHz, 10:1 LVDS SERIALIZER/DESERIALIZER

FEATURES

- **100-Mbps to 400-Mbps Serial LVDS Data Payload Bandwidth at 10-MHz to 40-MHz System Clock**
- **Pin-Compatible Superset of NSM DS92LV1021/DS92LV1212**
- **Chipset (Serializer/Deserializer) Power Consumption <350 mW (Typ) at 40 MHz**
- **Synchronization Mode for Faster Lock**
- **Lock Indicator**
- **No External Components Required for PLL**
- **Low-Cost 28-Pin SSOP Package**
- **Industrial Temperature Qualified, T_A = -40°C to 85°C**
- **Programmable Edge Trigger on Clock (Rising or Falling Edge)**
- **Flow-Through Pinout for Easy PCB Layout**

DESCRIPTION

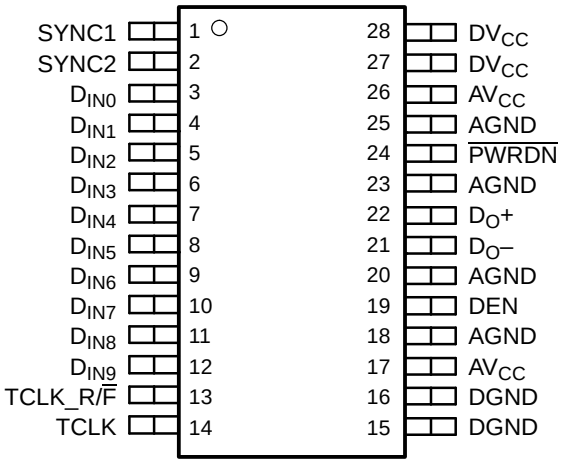
The SN65LV1021 serializer and SN65LV1212 deserializer comprise a 10-bit serdes chipset designed to transmit and receive serial data over LVDS differential backplanes at equivalent parallel word rates from 10 MHz to 40 MHz. Including overhead, this translates into a serial data rate between 120-Mbps and 480-Mbps payload-encoded throughput.

Upon power up, the chipset link can be initialized via a synchronization mode with internally generated SYNC patterns, or the deserializer can be allowed to synchronize to random data. By using the synchronization mode, the deserializer establishes lock within specified, shorter time parameters.

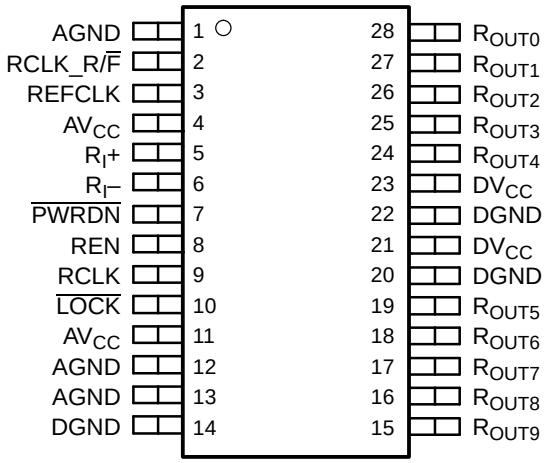
The device can be entered into a power-down state when no data transfer is required. Alternatively, a mode is available to place the output pins in the high-impedance state without losing PLL lock.

The SN65LV1021 and SN65LV1212 are characterized for operation over ambient air temperature of -40°C to 85°C.

SN65LV1021
Serializer



SN65LV1212
Deserializer

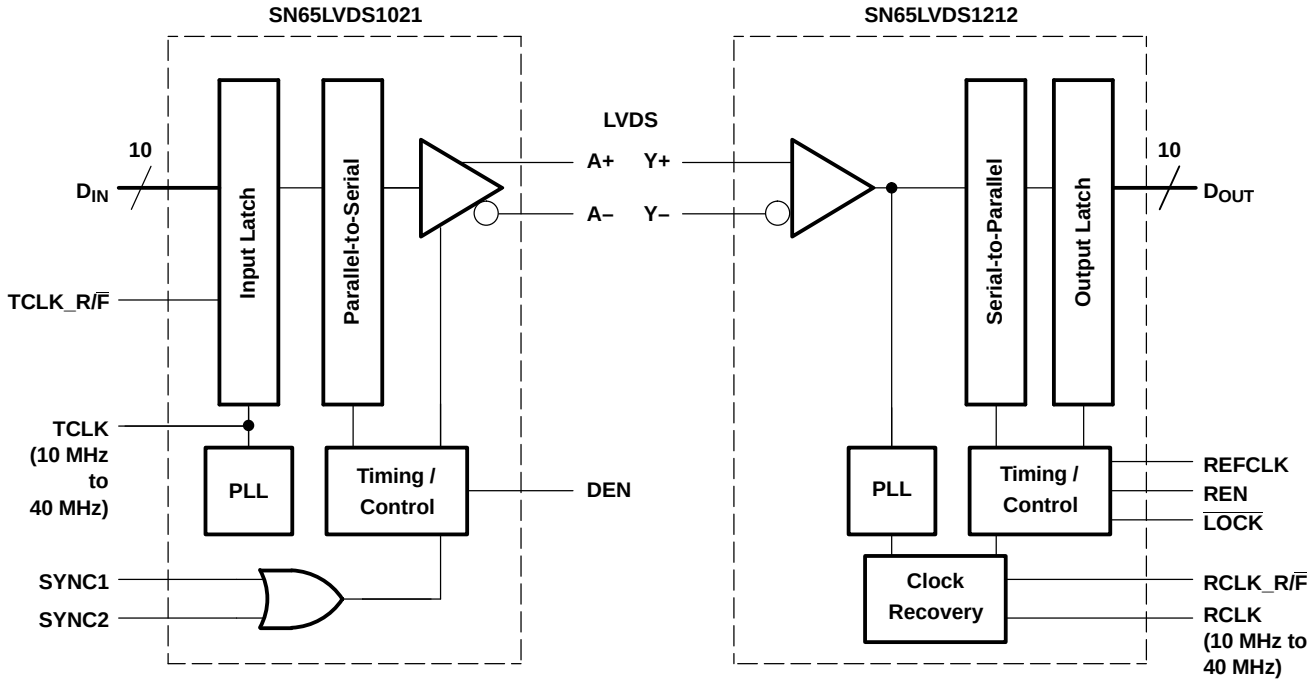


ORDERING INFORMATION

DEVICE	PART NUMBER
Serializer	SN65LV1021DB
Deserializer	SN65LV1212DB

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

BLOCK DIAGRAMS



FUNCTIONAL DESCRIPTION

The SN65LV1021 and SN65LV1212 are a 10-bit serializer/deserializer chipset designed to transmit data over differential backplanes or unshielded twisted pair (UTP) at clock speeds from 10 MHz to 40 MHz. The chipset has five states of operation: initialization mode, synchronization mode, data transmission mode, power-down mode, and high-impedance mode. The following sections describe each state of operation.

INITIALIZATION MODE

Initialization of both devices must occur before data transmission can commence. Initialization refers to synchronization of the serializer and deserializer PLLs to local clocks.

When V_{CC} is applied to the serializer and/or deserializer, the respective outputs enter the high-impedance state, while on-chip power-on circuitry disables internal circuitry. When V_{CC} reaches 2.45 V, the PLL in each device begins locking to a local clock. For the serializer, the local clock is the transmit clock (TCLK) provided by an external source. For the deserializer, a local clock must be applied to the REFCLK pin. The serializer outputs remain in the high-impedance state, while the PLL locks to the TCLK.

SYNCHRONIZATION MODE

The deserializer PLL must synchronize to the serializer in order to receive valid data. Synchronization can be accomplished in one of two ways:

- **RAPID SYNCHRONIZATION:** The serializer has the capability to send specific SYNC patterns consisting of six ones and six zeros switching at the input clock rate. The transmission of SYNC patterns enables the deserializer to lock to the serializer signal within a deterministic time frame. This transmission of SYNC patterns is selected via the SYNC1 and SYNC2 inputs on the serializer. Upon receiving valid a SYNC1 or SYNC2 pulse (wider than 6 clock cycles), 1026 cycles of SYNC pattern are sent.

FUNCTIONAL DESCRIPTION (continued)

When the deserializer detects edge transitions at the LVDS input, it attempts to lock to the embedded clock information. The deserializer $\overline{\text{LOCK}}$ output remains high while its PLL locks to the incoming data or SYNC patterns present on the serial input. When the deserializer locks to the LVDS data, the $\overline{\text{LOCK}}$ output goes low. When $\overline{\text{LOCK}}$ is low, the deserializer outputs represent incoming LVDS data. One approach is to tie the deserializer $\overline{\text{LOCK}}$ output directly to SYNC1 or SYNC2.

- **RANDOM-LOCK SYNCHRONIZATION:** The deserializer can attain lock to a data stream without requiring the serializer to send special SYNC patterns. This allows the SN65LV1212 to operate in open-loop applications. Equally important is the deserializer's ability to support hot insertion into a running backplane. In the open-loop or hot-insertion case, it is assumed the data stream is essentially random. Therefore, because lock time varies due to data stream characteristics, the exact lock time cannot be predicted. The primary constraint on the random lock time is the initial phase relation between the incoming data and the REFCLK when the deserializer powers up.

The data contained in the data stream can also affect lock time. If a specific pattern is repetitive, the deserializer could enter false lock—falsely recognizing the data pattern as the start/stop bits. This is referred to as repetitive multitransition (RMT);see Figure 1 for RMT examples. RMT occurs when more than one low-high transition takes place per clock cycle over multiple cycles. In the worst case, the deserializer could become locked to the data pattern rather than the clock. Circuitry within the deserializer can detect that the possibility of false lock exists. Upon detection, the circuitry prevents the $\overline{\text{LOCK}}$ output from becoming active until the potential false lock pattern changes. Notice that the RMT pattern only affects the deserializer lock time, and once the deserializer is in lock, the RMT pattern does not affect the deserializer state as long as the same data boundary happens each cycle. The deserializer does not go into lock unitil it finds a unique four consecutive cycles of data boundary (stop/start bits) at the same position.

The deserializer stays in lock until it cannot detect the same data boundary (stop/start bits) for four consecutive cycles. Then the desiralizer goes out of lock and hunts for the new data boundary (stop/start bits). In the event of loss of synchronization, the $\overline{\text{LOCK}}$ pin output goes high and the outputs (including RCLK) enter a high-impedance state. The user's system should monitor the $\overline{\text{LOCK}}$ pin in order to detect a loss of synchronization. Upon detection of loss of lock, sending sync patterns for resynchronization is desirable if reestablishing lock within a specific time is critical. However, the deserializer can lock to random data as previously noted.

FUNCTIONAL DESCRIPTION (continued)

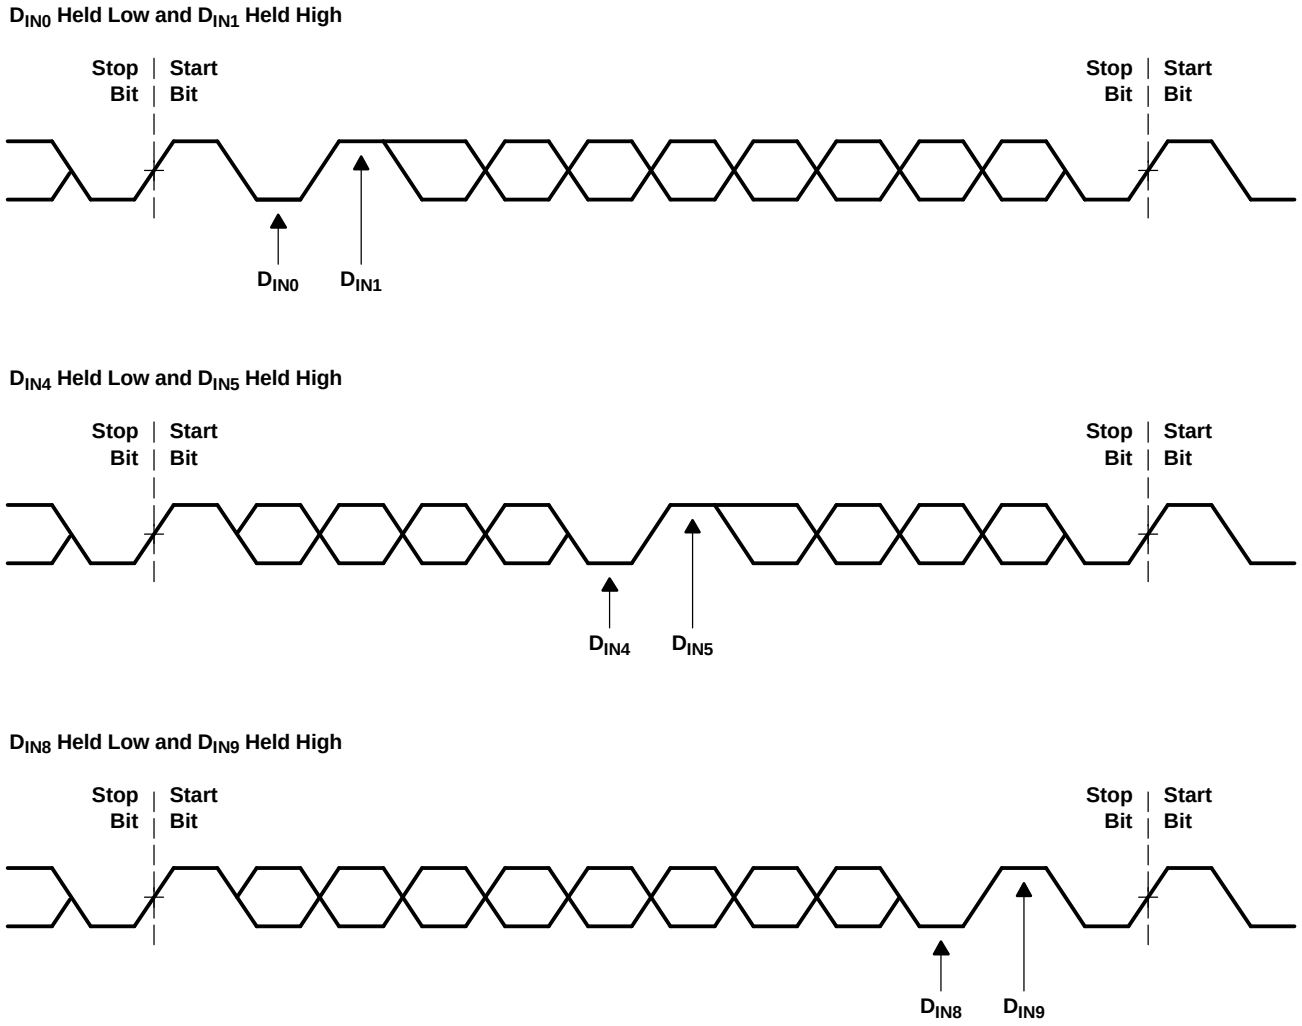


Figure 1. RMT Pattern Examples

DATA TRANSMISSION MODE

After initialization and synchronization, the serializer accepts parallel data from inputs D_{IN0}-D_{IN9}. The serializer uses the TCLK input to latch the incoming data. The TCLK_R/$\overline{F}$ pin selects which edge the serializer uses to strobe incoming data. If either of the SYNC inputs is high for 6 TCLK cycles, the data at D_{IN0}-D_{IN9} is ignored regardless of the clock edge selected and 1026 cycles of SYNC pattern are sent.

After determining which clock edge to use, a start and stop bit, appended internally, frames the data bits in the register. The start bit is always high and the stop bit is always low. The start and stop bits function as the embedded clock bits in the serial stream.

The serializer transmits serialized data and appended clock bits (10+2 bits) from the serial data output (DO±) at 12 times the TCLK frequency. For example, if TCLK is 10 MHz, the serial rate is 10 × 12 = 120 Mbps. Because only 10 bits are input data, the useful data rate is 10 times the TCLK frequency. For instance, if TCLK = 12 MHz, the useful data rate is 10 × 12 = 120 Mbps. The data source, which provides TCLK, must be in the range of 10 MHz to 40 MHz.

The serializer outputs (DO±) can drive point-to-point connections or limited multipoint or multidrop backplanes. The outputs transmit data when the enable pin (DEN) is high, $\overline{PWRDN}$ is high, and SYNC1 and SYNC2 are low. When DEN is driven low, the serializer output pins enter the high-impedance state.

FUNCTIONAL DESCRIPTION (continued)

Once the deserializer has synchronized to the serializer, the $\overline{\text{LOCK}}$ pin transitions low. The deserializer locks to the embedded clock and uses it to recover the serialized data. R_{OUTx} data is valid when $\overline{\text{LOCK}}$ is low, otherwise R_{OUT0}-R_{OUT9} is invalid. The R_{OUT0}-R_{OUT9} data is strobed out by RCLK. The specific RCLK edge polarity to be used is selected by the RCLK_R/$\overline{\text{F}}$ input. The R_{OUT0}-R_{OUT9}, $\overline{\text{LOCK}}$ and RCLK outputs can drive a maximum of three CMOS input gates (15-pF load, total for all three) with a 40-MHz clock.

POWER DOWN

When no data transfer is required, the power-down mode can be used. The serializer and deserializer use the power-down mode, a low-power sleep mode, to reduce power consumption. The deserializer enters power down when you drive $\overline{\text{PWRDN}}$ and REN low. The serializer enters power down when the $\overline{\text{PWRDN}}$ is driven low. In power down, the PLL stops and the outputs enter a high-impedance state, which disables load current and reduces supply current to the milliampere range. To exit power down, you must drive the $\overline{\text{PWRDN}}$ pin high.

Before valid data exchanges between the serializer and deserializer can resume, you must reinitialize and resynchronize the devices to each other. Initialization of the serializer takes 1026 TCLK cycles. The deserializer initializes and drives $\overline{\text{LOCK}}$ high until lock to the LVDS clock occurs.

HIGH-IMPEDANCE MODE

The serializer enters the high-impedance mode when the DEN pin is driven low. This puts both driver output pins (DO+ and DO-) into a high-impedance state. When you drive DEN high, the serializer returns to its previous state, as long as all other control pins remain static (SYNC1, SYNC2, $\overline{\text{PWRDN}}$, TCLK_R/$\overline{\text{F}}$). When the REN pin is driven low, the deserializer enters high-impedance mode. Consequently, the receiver output pins (R_{OUT0}-R_{OUT9}) and RCLK are placed into the high-impedance state. The $\overline{\text{LOCK}}$ output remains active, reflecting the state of the PLL.

Deserializer Truth Table

INPUTS		OUTPUTS		
$\overline{\text{PWRDN}}$	REN	ROUT[0:9]	$\overline{\text{LOCK}}$ (1), (2)	RCLK (3)
H	H	Z	H	Z
H	H	Active	L	Active
L	X	Z	Z	Z
H	L	Z	Active	Z

(1) $\overline{\text{LOCK}}$ output reflects the state of the deserializer with regard to the selected data stream.
(2) ROUT and RCLK are 3-stated when $\overline{\text{LOCK}}$ is asserted high.
(3) RCLK active indicates the RCLK is running if the deserializer is locked. The timing of RCLK with respect to ROUT is determined by RCLK_R/$\overline{\text{F}}$.

TERMINAL FUNCTIONS

PIN	NAME	DESCRIPTION
SERIALIZER		
1, 2	SYNC1, SYNC2	LVTTL logic inputs SYNC1 and SYNC2 are ORed together. When at least one of the two pins is asserted high for 6 cycles of TCLK, the serializer initiates transmission of a minimum 1026 SYNC patterns. If after completion of transmission of 1026 patterns SYNC continues to be asserted, then the transmission continues until SYNC is driven low and if the time SYNC holds > 6 cycles, another 1026 SYNC pattern transmission initiates.
3-12	D_{IN0}-D_{IN9}	Parallel LVTTL data inputs
13	TCLK_R/$\overline{F}$	LVTTL logic input. Low selects a TCLK falling-edge data strobe; high selects a TCLK rising-edge data strobe.
14	TCLK	LVTTL-level reference clock input. The SN65LV1021 accepts a 10-MHz to 40-MHz clock. TCLK strobes parallel data into the input latch and provides a reference frequency to the PLL.
15, 16	DGND	Digital circuit ground
18, 20, 23, 25	AGND	Analog circuit ground (PLL and analog circuits)
17, 26	AV_{CC}	Analog circuit power supply (PLL and analog circuits)
19	DEN	LVTTL logic input. Low puts the LVDS serial output into the high-impedance state. High enables serial data output.
21	D_O-	Inverting LVDS differential output
22	D_O+	Noninverting LVDS differential output
27, 28	DV_{CC}	Digital circuit power supply
24	$\overline{PWRDN}$	LVTTL logic input. Asserting this pin low turns off the PLL and places the outputs into the high-impedance state, putting the device into a low-power mode.
DESERIALIZER		
3	REFCLK	LVTTL logic input. Use this pin to supply a REFCLK signal for the internal PLL frequency.
15-19, 24-28	R_{OUT0}-R_{OUT9}	Parallel LVTTL data outputs
2	RCLK_R/$\overline{F}$	LVTTL logic input. Low selects an RCLK falling-edge data strobe; high selects an RCLK rising-edge data strobe.
9	RCLK	LVTTL-level output recovered clock. Use RCLK to strobe R_{OUTx}.
14, 20, 22	DGND	Digital circuit ground
1, 12, 13	AGND	Analog circuit ground (PLL and analog circuits)
4, 11	AV_{CC}	Analog circuit power supply (PLL and analog circuits)
8	REN	LVTTL logic input. Low places R_{OUT0}-R_{OUT9}, $\overline{LOCK}$, and RCLK in the high-impedance state.
5	R_I+	Serial data input. Noninverting LVDS differential input
6	R_I-	Serial data input. Inverting LVDS differential input
10	$\overline{LOCK}$	LVTTL-level output. $\overline{LOCK}$ goes low when the deserializer PLL locks onto the embedded clock edge.
21, 23	DV_{CC}	Digital circuit power supply
7	$\overline{PWRDN}$	LVTTL logic input. Asserting this pin low turns off the PLL and places outputs into a high-impedance state, putting the device into a low-power mode.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) (1)

			UNIT
V_{CC} to GND			-0.3 V to 4 V
	LVTTL input voltage		-0.3 V to (V_{CC} + 0.3 V)
	LVTTL output voltage		-0.3 V to (V_{CC} + 0.3 V)
	LVDS receiver input voltage		-0.3 V to 3.9 V
	LVDS driver output voltage		-0.3 V to 3.9 V
	LVDS output short circuit duration		Continuous
	Electrostatic discharge:	HBM	up to 6 kV
		MM	up to 200 V
	Junction temperature		150°C
	Storage temperature		-65°C to 150°C
	Lead temperature (soldering, 4 seconds)		260°C
T_A = 25°C	Maximum package power dissipation		1.27 W
	Package derating		10.3 mW/°C above 25°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
V_{CC} (1)	Supply voltage	3	3.3	3.6	V
	Receiver input voltage range	0		2.4	V
V_{CM}	Receiver input common mode range	$\frlvert V_{ID} \frrvert / 2$		$2.4 - \frlvert V_{ID} \frrvert / 2$	V
	Supply noise voltage			100	mV_{P-P}
T_A	Operating free-air temperature	-40	25	85	°C

(1) By design, DVCC and AVCC are separated internally and does not matter what the difference is for XDVCC-AVCCX, as long as both are within 3 V to 3.6 V.

ELECTRICAL CHARACTERISTICS

over recommended operating supply and temperature ranges (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SERIALIZER LVCMOS/LVTTL DC SPECIFICATIONS (see Note (1))						
V_{IH}	High-level input voltage		2		V_{CC}	V
V_{IL}	Low-level input voltage		GND		0.8	V
V_{CL}	Input clamp voltage	I_{CL} = -18 mA			-1.5	V
I_{IN}	Input current (see Note (2))	V_{IN} = 0 V or 3.6 V	-200	±100	200	µA
DESERIALIZER LVCMOS/LVTTL DC SPECIFICATIONS (see Note (3))						
V_{IH}	High-level input voltage		2		V_{CC}	V
V_{IL}	Low-level input voltage		GND		0.8	V
V_{CL}	Input clamp voltage	I_{CL} = -18 mA		-0.62	-1.5	V

$t_{d(HZ)}$	High-to-high impedance state delay	See Figure 14	R_{OUT0}-R_{OUT9}, $\overline{LOCK}$		6.7	8	ns
$t_{d(LZ)}$	Low-to-high impedance state delay				4.6	8	
$t_{d(ZH)}$	High-impedance state-to-high delay				5.5	8	
$t_{d(ZL)}$	High-impedance state-to-low delay				4.8	8	

DESERIALIZER SWITCHING CHARACTERISTICS (continued)

over recommended operating supply and temperature ranges (unless otherwise specified)

PARAMETER		TEST CONDITIONS	PIN/FREQ	MIN	TYP	MAX	UNIT
$t_{(DSR1)}$	Deserializer PLL lock time from $\overline{PWRDN}$(with SYNCPAT)	See Figure 15,Figure 16, and Note (1)	10 MHz			$(1024+26)t_{RFCP}$	µs
			40 MHz			$(1024+26)t_{RFCP}$	
$t_{(DSR2)}$	Deserializer PLL lock time from SYNCPAT		10 MHz			0.7	
			40 MHz			0.2	
$t_{d(ZHL)}$	High-impedance state-to-high delay (power up)		$\overline{LOCK}$			3	ns
$t_{(RNM)}$	Deserializer noise margin	See Figure 17 and Note (2)	10 MHz		3680		ps
			40 MHz		1100		

(1) $t_{(DSR1)}$ represents the time required for the deserializer to register that a lock has occurred upon power up or when leaving the power-down mode. $t_{(DSR2)}$ represents the time required to register that a lock has occurred for the powered up and enabled deserializer when the input (RI±) conditions change from not receiving data to receiving synchronization patterns (SYNCPATs). In order to specify deserializer PLL performance t_{DSR1} and t_{DSR2} are specified with REFCLK active and stable and specific conditions of SYNCPATs.

(2) t_{RNM} represents the phase noise or jitter that the deserializer can withstand in the incoming data stream before bit errors occur.

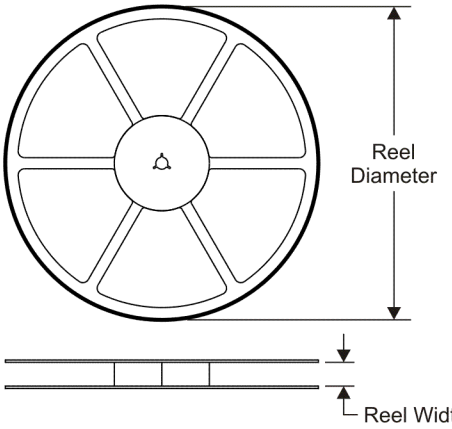
(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

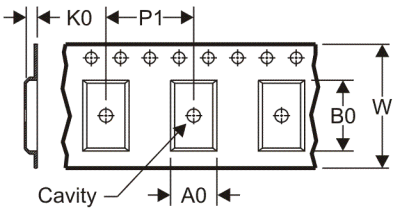
(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
