| <b>Description:</b> | Sets the efficiency optimization. When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load.<br>For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.                                                                          |                                |                                    |
| <b>Note:</b>        | It only makes sense to activate this function if the dynamic response requirements of the speed controller are low. In order to avoid oscillations, if required, the speed controller parameters should be adapted (increase Tn, reduce Kp).<br>Further, the smoothing time of the flux setpoint filter (p1582) should be increased.                  |                                |                                    |

| <b>Description:</b> | Sets the pulse frequency for the converter.<br>This parameter is pre-set to the rated converter value when the drive is first commissioned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                  |                                       |
| <b>Dependency:</b>  | Refer to: p0230                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                  |                                       |
| <b>Note:</b>        | The maximum possible pulse frequency is also determined by the power unit being used.<br>When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).<br>If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be set below the minimum value required for the filter.<br>For operation with output reactors, the pulse frequency is limited to 4 kHz (see p0230).<br>If p1800 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082). |                                  |                                       |

| <b>Dependency:</b>  | If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only space vector modulation without overcontrol can be selected as modulation type (p1802 = 3).<br>Refer to: p0230, p0500                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                  |                                       |
| <b>Note:</b>        | When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 2,10), the modulation depth must be limited using p1803 (default p1803 < 100 %). The higher the overmodulation, the greater the current ripple and torque ripple.<br>When changing p1802[x], the values for all of the other existing indices are also changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                  |                                       |

| <b>Description:</b> | Sets the speed for the identification of the moment of inertia and the vibration test.<br>Induction motor:<br>The percentage value is referred to p0310 (rated motor frequency).<br>Synchronous motor:<br>The percentage value is referred to the minimum from p0310 (rated motor frequency) and p1082 (maximum speed).                                                                                 |                              |                                   |
| <b>Dependency:</b>  | Refer to: p0310, p1959<br>Refer to: F07984, F07985                                                                                                                                                                                                                                                                                                                                                      |                              |                                   |
| <b>Note:</b>        | In order to calculate the inertia, sudden speed changes are carried out - the specified value corresponds to the lower speed setpoint. This value is increased by 20 % for the upper speed value. The q leakage inductance (refer to p1959 bit 5) is determined at zero speed and at 50% of p1965 - however, with a maximum output frequency of 15 Hz and at a minimum of 10% of the rated motor speed. |                              |                                   |

| <b>Description:</b> | Sets the processing mode for PROFdrive STW1.10 "master control by PLC".<br>Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter. |                          |                              |
| <b>Value:</b>       | 0: Freeze setpoints and continue to process sign-of-life<br>1: Freeze setpoints and sign-of-life<br>2: Setpoints are not frozen                                                                                                                                                                                                                                                              |                          |                              |
| <b>Note:</b>        | If the STW1 is not transferred according to the PROFdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.                                                                                                                                                                                                                                                    |                          |                              |

**Description:** Selects the faults for which the fault response should be changed

**Dependency:** The fault is selected and the required response is set under the same index.  
Refer to: p2101

**Notice:** For the following cases, it is not possible to re-parameterize the fault response to a fault:

- if there is no existing fault number.
- the message type is not "fault" (F).
- when a fault is present.

| <b>Min</b><br>1             | <b>Max</b><br>2          | <b>Factory setting</b><br>1 |

**Description:** Sets the acknowledge mode for selected fault.

**Value:** 1: Acknowledgment only using POWER ON  
2: Ack IMMEDIATELY after the fault cause has been removed

**Dependency:** Selects the faults and sets the required acknowledge mode realized under the same index  
Refer to: p2126

**Notice:** It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:  
- if there is no existing fault number.  
- the message type is not "fault" (F).  
- when a fault is present.

**Note:** The acknowledge mode can only be changed for faults with the appropriate identification.  
Example:  
F12345 and acknowledge mode = IMMEDIATE (POWER ON)  
--> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

| <b>Notice:</b>      | For p0014 = 1, the following applies:<br>After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                               |                              |                 |                                         |
| <b>Note:</b>        | Re bit 00:<br>0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.<br>1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.<br>Re bit 02:<br>0: Without initial rounding-off<br>1: With initial rounding-off.<br>The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).<br>It is calculated as follows:<br>$r = 0.0001 \times \max(p2237,  p2238 ) \text{ [%]} / 0.13^2 \text{ [s}^2\text{]}$<br>The jerk is effective until the maximum acceleration is reached ( $a_{\max} = p2237 \text{ [%]} / p2247 \text{ [s]}$ or $a_{\max} = p2238 \text{ [%]} / p2248 \text{ [s]}$ ), after which the drive continues to run linearly with constant acceleration. The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.<br>Re bit 03:<br>0: Non-volatile data save de-activated.<br>1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).<br>Re bit 04:<br>When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250. |                                               |                              |                 |                                         |
| <b>r2231</b>        | <b>Technology controller motorized potentiometer setpoint memory / Tec_ctrl mop mem</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                               |                              |                 |                                         |

| <b>Description:</b> | Sets the integral time (I component, integrating time constant) of the technology controller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                              |                                      |
| <b>Notice:</b>      | The following applies for p2251 = 0:<br>If the output of the technology controller lies within the range of a suppression (skip) bandwidth (p1091 ... p1092, p1101) or below the minimum speed (p1080), the integral component of the controller is held so that the controller temporarily works as a P controller. This is necessary in order to prevent the controller from behaving in an unstable manner, as the ramp-function generator switches to the parameterized up and down ramps (p1120, p1121) at the same time in order to avoid setpoint steps. This state can be exited or avoided by changing the controller setpoint or by using the start speed (= minimum speed). |                              |                                      |
| <b>Note:</b>        | When the controller output reaches the limit, the I component of the controller is held.<br>p2285 = 0:<br>The integral time is disabled and the I component of the controller is reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                              |                                      |

| <b>Description:</b> | Sets the response of the technology controller to the occurrence of a fault F07426 (technology controller actual value limited). The fault response is executed if status bits 8 or 9 in technology controller status word r2349 are set. If both status bits are zero, a switch back to technology controller operation will follow.                                                                                                                       |                          |                                   |
| <b>Value:</b>       | 0: Function inhibited<br>1: On fault: Changeover to r2344 (or p2302)<br>2: On fault: Changeover to p2215                                                                                                                                                                                                                                                                                                                                                    |                          |                                   |
| <b>Dependency:</b>  | The parameterized fault response is only effective if the technology controller mode is set to p2251 = 0 (technology controller as main setpoint).<br>Refer to: p2267, p2268, r2344<br>Refer to: F07426                                                                                                                                                                                                                                                     |                          |                                   |
| <b>Notice:</b>      | Dependent upon the application, the changing over of the setpoint when fault F07426 occurs can lead to the fault condition disappearing and the re-activation of the technology controller. This can repeat itself and cause limit oscillations. In this case a suitable fault response or a different fixed setpoint 15 for the fault response p2345 = 2 should be selected.                                                                               |                          |                                   |
| <b>Note:</b>        | The parameterized fault response can only be achieved if the default fault response of the technology controller fault F07426 is set to "NONE" (see p2100, p2101). If a fault response other than "NONE" is entered in p2101 for F07426, p2345 must be set to zero.<br>If the fault occurs during ramping up to the starting setpoint p2302, this starting setpoint is retained as the final value (there is no changeover to the fault response setpoint). |                          |                                   |

| <b>Description:</b> | Compound braking current is used to define the amount of DC current that is produced on stopping the motor during U/f operation to further increase the DC brake function.<br><br>Compound braking is a superimposition of the DC brake function with regenerative braking (net braking along the ramp) after OFF1 or OFF3. This permits braking with controlled motor frequency and minimum power input into the motor. Effective braking without using additional hardware components is obtained by optimizing the ramp down time and compound braking.          |  |                          |  |                                    |
| <b>Dependency:</b>  | The compound braking current is only activated if the DC link voltage exceeds the threshold value in r1282.<br>Compound braking does not operate:<br>- when DC braking is active (refer to p1230, r1239)<br>- as long as the motor is not magnetized (e.g. for flying restart)<br>- for vector control (p1300 >= 20)<br>- for synchronous motors (p0300 = 2xx)                                                                                                                                                                                                      |  |                          |  |                                    |
| <b>Caution:</b>     | Generally, increasing the braking current improves the braking effect when stopping the motor. However, if the value is set too high, then the drive can be tripped (shut down) as a result of overcurrent or ground fault.<br>Recommendation: $p3856 < 100 \% \times (r0209 - r0331) / p0305 / 2$<br>Compound braking generates a current in the motor with a ripple manifesting the rotational frequency. The higher the braking current is set, the higher the resulting ripple, especially when the Vdc(max) control is simultaneously active (refer to p1280). |  |                          |  |                                    |
| <b>Note:</b>        | The parameter value is entered relative to the rated motor current (p0305). Compound braking is deactivated with p3856 = 0%.                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |                          |  |                                    |

**r8680[0...36] CAN Diagnosis Hardware / Diagnostics HW**

G120C CAN      **Access level:** 3      **Calculated:** -      **Data type:** Unsigned16  
**Can be changed:** -      **Scaling:** -      **Data set:** -  
**Units group:** -      **Unit selection:** -

**Min**      **Max**      **Factory setting**  
-      -      -

**Description:** Displays the register of the CAN controller C\_CAN:  
Register, Message Interface Register and Message Handler Register - referred to the CAN protocol.

**Index:** [0] = Control register  
[1] = Status register  
[2] = Error counter  
[3] = Bit timing register  
[4] = Interrupt register  
[5] = Test register  
[6] = Baud rate prescaler extension register  
[7] = Interface 1 command request register  
[8] = Interface 1 command mask register

**Note:** A description of the individual registers of the C\_CAN controller can be taken from "C\_CAN User's Manual".

**p8684 CAN NMT state after booting / NMT state aft boot**

G120C CAN      **Access level:** 3      **Calculated:** -      **Data type:** Integer16  
**Can be changed:** T      **Scaling:** -      **Data set:** -  
**Units group:** -      **Unit selection:** -

**Min**      **Max**      **Factory setting**  
4      127      127

**Description:** Sets the CANopen NMT state that is effective after booting.

**Value:** 4: Stopped  
5: Operational  
127: Pre-operational

**Dependency:** Refer to: p8685

**Note:** Booting in the NMT state pre-operational corresponds to the CANopen standard

**p8685 CAN NMT states / NMT states**

G120C CAN      **Access level:** 3      **Calculated:** -      **Data type:** Integer16  
**Can be changed:** U, T      **Scaling:** -      **Data set:** -  
**Units group:** -      **Unit selection:** -

**Min**      **Max**      **Factory setting**  
0      129      127

**Description:** Sets and displays the CANopen NMT state.

**Value:** 0: Initializing  
4: Stopped  
5: Operational  
127: Pre-operational  
128: Reset node  
129: Reset Communication

**Note:** The value 0 (initialization) is only displayed and cannot be set.

## 1.5 Quick commissioning (p0010 = 1)

The following parameters are necessary for quick commissioning (p0010 = 1).

Table 1-7 Quick commissioning (p0010 = 1)

| Par.-No. | Name                                               | Access level | Can be changed |
|----------|----------------------------------------------------|--------------|----------------|
| p0010    | Drive commissioning parameter filter               | 1            | C(1)T          |
| p0015    | Macro drive unit                                   | 1            | C(1)           |
| p0100    | IEC/NEMA mot stds                                  | 1            | C(1)           |
| p0205    | Power unit application                             | 1            | C(1,2)         |
| p0230    | Drive filter type, motor side                      | 1            | C(1,2)         |
| p0300    | Motor type selection                               | 2            | C(1,3)         |
| p0301    | Motor code number selection                        | 2            | C(1,3)         |
| p0304    | Rated motor voltage                                | 1            | C(1,3)         |
| p0305    | Rated motor current                                | 1            | C(1,3)         |
| p0307    | Rated motor power                                  | 1            | C(1,3)         |
| p0308    | Rated motor power factor                           | 1            | C(1,3)         |
| p0309    | Rated motor efficiency                             | 1            | C(1,3)         |
| p0310    | Rated motor frequency                              | 1            | C(1,3)         |
| p0311    | Rated motor speed                                  | 1            | C(1,3)         |

| p0322    | Maximum motor speed                                | 1            | C(1,3)         |
| p0323    | Maximum motor current                              | 1            | C(1,3)         |
| p0335    | Motor cooling type                                 | 2            | C(1,3)T        |
| p0500    | Technology application                             | 2            | C(1,5)T        |
| p0640    | Current limit                                      | 2            | C(1,3)UT       |
| p0922    | PROFIdrive telegram selection                      | 1            | C(1)T          |
| p0970    | Reset drive parameters                             | 1            | C(1,30)        |
| p1080    | Minimum speed                                      | 1            | C(1)T          |
| p1082    | Maximum speed                                      | 1            | C(1)T          |
| p1120    | Ramp-function generator ramp-up time               | 1            | C(1)UT         |
| p1121    | Ramp-function generator ramp-down time             | 1            | C(1)UT         |
| p1135    | OFF3 ramp-down time                                | 2            | C(1)UT         |
| p1300    | Open-loop/closed-loop control operating mode       | 2            | C(1)T          |
| p1900    | Motor data identification and rotating measurement | 2            | C(1)T          |
| p3900    | Completion of quick commissioning                  | 1            | C(1)           |

When p0010 = 1 is chosen, p0003 (user access level) can be used to select the parameters to be accessed.

At the end of the quick commissioning sequence, set p3900 = 1 to carry out the necessary motor calculations and clear all other parameters (not included in p0010 = 1) to their default settings.

---

**Note**

This applies only in Quick Commissioning mode.

Fig. 2-2 1021 – Explanation of the symbols (Part 2)

**Symbols for logic functions****Logical inversion****AND element with logical inversion of an input signal****OR element****Exclusiv-OR/XOR**

y = 1 when x1 != x2 is.

**R/S flip-flop**

S = setting input

R = reset input

Q = non-inverted output

Q = inverted output

**Symbols for computational and closed-loop control functions****Sign reversal**

y = -x

**Absolute value generator**

y = |x|

**Divider** $y = \frac{x_1}{x_2}$ **Comparator**

Output y = a logical "1", if the analog signal x &gt; 0, i.e. is positive.

**Differentiator** $y = \frac{dx}{dt}$ **Symbol for monitoring****Monitoring****Symbols for computational and closed-loop control functions****Threshold value switch 1/0**

Outputs at y a logical "1" if x &lt; S.

**Threshold value switch 0/1**

Outputs at y a logical "1" if x &gt; S.

**Threshold value 1/0 with hysteresis**

Outputs a logical "1" at y if x &lt; S.

If x &gt;= S + H then y returns to 0.

**Threshold value 0/1 with hysteresis**

Outputs a logical "1" at y if x &gt; S.

If x &lt;= S - H then y returns to 0.

**Limiter**

x is limited to the upper limit LU and the lower limit LL and output at y.

The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

**Sample & Hold element**

Sample and hold element.

y = x if SET = 1

(not retentively saved at POWER OFF)

## Handling BICO technology

**Binector:** 

**Connector:** 

Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques).  
Connectors are also "CO:" display parameters (CO = Connector Output).

### Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:

"BI:" parameter for binectors (BI = Binector Input)

or

"CI:" parameter for connectors (CI = Connector Input)

### Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI0 (BO: r0722.0, Terminal 5 (K1.5)) on the CU.

### Parameterizing steps:

- ① p1055[0] = 722.0      Terminal 5 (K1.5) acts as "Jog bit 0".
- ② p1070[0] = 1050      The output of the motorized potentiometer acts as main setpoint for the speed controller.

Fig. 2-20 9360 – Receive telegram, free interconnection via BICO

<1> The send word 1 must be used as status word (ZSW1). The preconfiguration is set automatically via p0700 = 6.  
<2> The preconfiguration with the speed setpoint is set automatically via p1000 = 6.  
<3> Physical word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex, if the input variable has the value p200x).  
The following applies for temperature values: 100° C -> 100 % = 4000 hex; 0° C -> 0%.

<1> The fault response and acknowledge mode for all faults and alarms are set to meaningful default values in the factory setting. Changes that may be required are only possible in specific value ranges specified by SIEMENS. When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

| 3.2 | List of Faults and Alarms    | 3-412 |

## 3.1 Faults and Alarms – Overview

### 3.1.1 General information

#### Indicating fault and alarm messages (faults and alarms)

A message comprises a letter followed by the relevant number.

The letter characterizes the message type and has the following meaning:

- A means "Alarm"
- F means "Fault"
- N means "No Report" or "Internal Report"
- C means Safety message

Brackets including the letters A, F, or N indicate that the message type can be changed, e.g. A01016 (F) means that the alarm A01016 can be parameterized as a fault. This function is not enabled for SINAMICS G120C.

Faults are stored in parameter r0945/r0947, under their code number (e.g. F01003 = 1003). The associated fault value can be found in parameter r0949. The value 0 is entered if a fault has no fault value. It is furthermore possible to read out the point in time that a fault occurred (r0948) and the number of faults (p0952).

Alarms are stored in parameter r2110/r2122, under their code number (e.g. A01503 = 1503) and can be read out from there. The associated alarm value can be found in parameter r2124 and the time of alarm occurrence in r2123.

## Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 3-1 Differences between faults and alarms

| Type   | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Faults | <p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault reaction is triggered.</li> <li>• Status bit ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults eliminated?</p> <ul style="list-style-type: none"> <li>• Remove the original cause of the fault.</li> <li>• Acknowledge the fault.</li> </ul> |
| Alarms | <p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status bit ZSW1.7 is set.</li> <li>• The alarm is entered in the alarm buffer.</li> </ul> <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. If the cause of the alarm is no longer present, then they automatically reset themselves.</li> </ul>         |

### 3.1.2 Fault reactions

Specifies the default reaction when a fault occurs. The optional brackets indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101). The following fault reactions are defined:

Table 3-2 Fault reactions

| List       | PROFI-drive   | Reaction                                                                            | Description                                                                                                                                                                                                                                                                                           |
|------------|---------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NONE       | -             | None                                                                                | No reaction when a fault occurs.                                                                                                                                                                                                                                                                      |

| STOP2      | -             | $n\_set = 0$                                                                        | <ul style="list-style-type: none"> <li>• <math>n\_set = 0</math> is input immediately to brake the drive along the OFF3 deceleration ramp (p1135). Although ramping down along the OFF3 deceleration ramp r0052 bit 5 = 1.</li> <li>• The drive remains in closed-loop speed control mode.</li> </ul> |
| IASC/DCBRk | -             | -                                                                                   | <ul style="list-style-type: none"> <li>• When a fault occurs with this fault reaction, DC braking is triggered.</li> <li>• The DC brake must have been put into operation (p1230 to p1239).</li> </ul>                                                                                                |

### 3.1.3 Acknowledgement of faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied. The optional brackets indicate whether the default acknowledgement can be changed and which acknowledgement can be adjusted via parameter (p2126, p2127).

Table 3-3 Acknowledgement of faults

| Acknowledgement | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 3.2 List of Faults and Alarms

Product: SINAMICS G120C, Version: 4402100, Language: eng,  
Objects: G120C CAN, G120C DP, G120C USS/MB

---

### F01000 Internal software error

**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error has occurred.  
 Fault value (r0949, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.  
**Remedy:**

- evaluate fault buffer (r0945).
- carry out a POWER ON (power off/on) for all components.
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

---

### F01001 FloatingPoint exception

**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An exception occurred during an operation with the FloatingPoint data type.  
 The error may be caused by the base system or an OA application (e.g., FBLOCKS, DCC).  
 Fault value (r0949, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.  
 Note:  
 Refer to r9999 for further information about this fault.  
 r9999[0]: Fault number.  
 r9999[1]: Program counter at the time when the exception occurred.  
 r9999[2]: Cause of the FloatingPoint exception.  
 Bit 0 = 1: Operation invalid  
 Bit 1 = 1: Division by zero  
 Bit 2 = 1: Overflow  
 Bit 3 = 1: Underflow  
 Bit 4 = 1: Imprecise result  
**Remedy:**

- carry out a POWER ON (power off/on) for all components.
- check configuration and signals of the blocks in FBLOCKS.
- check configuration and signals of DCC charts.
- upgrade firmware to later version.
- contact the Hotline.

---

### F01002 Internal software error

**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** An internal software error has occurred.  
 Fault value (r0949, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.  
**Remedy:**

- carry out a POWER ON (power off/on) for all components.
- upgrade firmware to later version.
- contact the Hotline.

---

### F01003 Acknowledgement delay when accessing the memory

**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A memory area was accessed that does not return a "READY".  
 Fault value (r0949, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.  
**Remedy:**

- carry out a POWER ON (power off/on) for all components.
- contact the Hotline.

---

**N01004 (F, A) Internal software error**

**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An internal software error has occurred.  
Fault value (r0949, hexadecimal):  
Only for internal Siemens troubleshooting.  
**Remedy:** - read out diagnostics parameter (r9999).  
- contact the Hotline.

---

**F01005 File upload/download error**

**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The upload or download of EEPROM data was unsuccessful.  
Fault value (r0949, interpret hexadecimal):  
yyxxxx hex: yy = component number, xxxx = fault cause  
xxxx = 000B hex = 11 dec:  
Power unit component has detected a checksum error.  
xxxx = 000F hex = 15 dec:  
The selected power unit will not accept the content of the EEPROM file.  
xxxx = 0011 hex = 17 dec:  
Power unit component has detected an internal access error.  
xxxx = 0012 hex = 18 dec:  
After several communication attempts, no response from the power unit component.  
xxxx = 008B hex = 140 dec:  
EEPROM file for the power unit component not available on the memory card.  
xxxx = 008D hex = 141 dec:  
An inconsistent length of the firmware file was signaled. It is possible that the download/upload has been interrupted.  
xxxx = 0090 hex = 144 dec:  
When checking the file that was loaded, the component detected a fault (checksum). It is possible that the file on the memory card is defective.  
xxxx = 0092 hex = 146 dec:  
This SW or HW does not support the selected function.  
xxxx = 009C hex = 156 dec:  
Component with the specified component number is not available (p7828).  
xxxx = Additional values:  
Only for internal Siemens troubleshooting.  
**Remedy:** Save a suitable firmware file or EEPROM file for upload or download in folder "/ee\_sac/" on the memory card.

---

**A01009 (N) CU: Control module overtemperature**

**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.  
**Remedy:** - check the air intake for the Control Unit.  
- check the Control Unit fan.  
**Note:**  
The alarm automatically disappears after the limit value has been undershot.

---

**F01010 Drive type unknown**

**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** An unknown drive type was found.  
**Remedy:** - replace Power Module.  
- carry out a POWER ON (power off/on).  
- upgrade firmware to later version.  
- contact the Hotline.

| <b>Remedy:</b>      | If you have saved the project data using the commissioning software, carry out a new download for your project. Save using the function "Copy RAM to ROM" or with p0971 = 1 so that all of the parameter files are again completely written to the non-volatile memory.<br>If you have not saved the project data, then first commissioning of the system has to be carried out again.                                                                                                                                                                              |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Cause:</b>       | A parameter has been changed that requires the parameters to be backed up and the Control Unit to be switched OFF and ON again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>      | <ul style="list-style-type: none"> <li>- Save parameters (p0971).</li> <li>- Switch Control Unit OFF/ON (POWER ON).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

---

**F01042      Parameter error during project download**

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** An error was detected when downloading a project using the commissioning software (e.g. incorrect parameter value).  
For the specified parameter, it was detected that dynamic limits were exceeded that may possibly depend on other parameters.  
Fault value (r0949, interpret hexadecimal):  
ccbbaaaa hex  
aaaa = Parameter  
bb = Index  
cc = fault cause  
0: Parameter number illegal.  
1: Parameter value cannot be changed.  
2: Lower or upper value limit exceeded.  
3: Sub-index incorrect.  
4: No array, no sub-index.  
5: Data type incorrect.  
6: Setting not permitted (only resetting).  
7: Descriptive element cannot be changed.  
9: Descriptive data not available.  
11: No master control.  
15: No text array available.  
17: Task cannot be executed due to operating state.  
20: Illegal value.  
21: Response too long.  
22: Parameter address illegal.  
23: Format illegal.  
24: Number of values not consistent.  
108: Unit unknown.  
Additional values:  
Only for internal Siemens troubleshooting.

**Remedy:** - enter the correct value in the specified parameter.  
- identify the parameter that restricts the limits of the specified parameter.

---

**F01043      Fatal error at project download**

**Reaction:** OFF2 (OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A fatal error was detected when downloading a project using the commissioning software.  
Fault value (r0949, decimal interpretation):  
1: Device status cannot be changed to Device Download (drive object ON?).  
2: Incorrect drive object number.  
8: Maximum number of drive objects that can be generated exceeded.  
11: Error while generating a drive object (global component).  
12: Error while generating a drive object (drive component).  
13: Unknown drive object type.  
14: Drive status cannot be changed to "ready for operation" (p0947 and p0949).  
15: Drive status cannot be changed to drive download.  
16: Device status cannot be changed to "ready for operation".  
18: A new download is only possible if the factory settings are restored for the drive unit.  
20: The configuration is inconsistent.  
Additional values: only for internal Siemens troubleshooting.

**Remedy:** - use the current version of the commissioning software.  
- modify the offline project and download again (e.g. compare the motor and Power Module in the offline project and on the drive).  
- change the drive state (is a drive rotating or is there a message/signal?).  
- carefully note any other messages/signals and remove their cause.

| <b>Acknowledge:</b> | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Cause:</b>       | The non-volatile buffer memory for parameter changes is filled to 100%.<br>All additional parameter changes will no longer be taken into account in the non-volatile buffer memory. However, parameter changes can still be made in the volatile memory (RAM).<br>This can also occur if the buffer memory is active (p0014 = 1) and parameters are continually changed via a fieldbus system.                                                                                                |
| <b>Remedy:</b>      | If required, de-activate and clear the buffer memory (p0014 = 0).<br>If required, clear the buffer memory (p0014 = 2).<br>In the following cases, the entries in the buffer memory are transferred into the ROM and then the buffer memory is cleared:<br>- p0971 = 1<br>- power down/power up the Control Unit                                                                                                                                                                               |

| <b>Cause:</b>        | <p>The drive-integrated "Safety Integrated" function on processor 1 has detected a fault in the crosswise data comparison between the two monitoring channels and has initiated a STOP F.</p> <p>Fault F01600 (SI P1: STOP A initiated) is output as a consequence of this fault.</p> <p>Fault value (r0949, decimal interpretation):</p> <p>0: Stop request from processor 2.</p> <p>1 ... 999:</p> <p>Number of the cross-checked data that resulted in this fault. This number is also displayed in r9795.</p> <p>2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.</p> <p>3: SI F-DI changeover tolerance time (p9650, p9850).</p> <p>8: SI PROFIsafe address (p9610, p9810).</p> <p>9: SI debounce time for STO (p9651, p9851).</p> <p>1000: Watchdog timer has expired. Within a time of approx. 5 x p9650, too many switching operations have occurred at F-DI, or STO (also as subsequent response) was initiated too frequently via PROFIsafe.</p> <p>1001, 1002: Initialization error, change timer / check timer.</p> <p>2000: Status of the STO selection for both monitoring channels are different.</p> <p>2001: Feedback of the safe pulse suppression on the two monitoring channels are different.</p> <p>6000 ... 6999:</p> <p>Error in the PROFIsafe control.</p> <p>For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions. The significance of the individual message values is described in safety message C01711.</p> |

| <b>Cause:</b>        | <p>One of the following values is saved in p9700 or was entered offline: 87 or 208.</p> <p>This is the reason that when booting, an attempt is made to copy SI parameters from processor 1 to processor 2. However, no safety-relevant function has been selected on processor 1 (p9501 = 0, p9601 = 0). This is the reason that copying is not possible.</p> <p>Note:</p> <p>This fault does not result in a safety stop response.</p> <p>See also: p9700 (SI copy function)</p>                                                                                                                                                                                     |

| <b>Acknowledge:</b>  | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Cause:</b>        | The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282).<br>The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds.<br>When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.<br>See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration (vector control)), p1280 (Vdc controller or Vdc monitoring configuration (U/f)) |
| <b>Remedy:</b>       | If the controller is not to intervene:<br>- increase the ramp-down times.<br>- switch-off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).<br>If the ramp-down times are not to be changed:<br>- use a chopper or regenerative feedback unit.                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Acknowledge:</b>  | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Cause:</b>        | During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen.                                                                                                                                                                                                                |
| <b>Remedy:</b>       | <ul style="list-style-type: none"><li>- de-activate the holding command for the ramp-function generator (p1141).</li><li>- suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).</li></ul>                                                                                                                            |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Cause:</b>        | Motor has been operating at the torque limit at a low speed for a longer period of time and below the set speed threshold.<br>This signal can also be triggered if the speed is oscillating and the speed controller output repeatedly goes to its limit. It may also be the case that thermal monitoring of the power unit reduces the current limit (see p0290), thereby causing the motor to decelerate. |
| <b>Remedy:</b>       | - check that the motor can rotate freely.<br>- check the torque limit: For a positive direction of rotation r1538, for a negative direction of rotation r1539.                                                                                                                                                                                                                                              |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Cause:</b>        | For a vector drive the system has identified that the motor has stalled for a time longer than is set.<br>Fault value (r0949, decimal interpretation):<br>1: Reserved.<br>2: Stall detection using r1408.12 (p1745).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>       | Steps should always be taken to ensure that both motor data identification and the rotating measurement were carried out (see p1900, r3925).<br>- check whether the drive stalls solely due to the load in controlled mode or when the speed setpoint is still zero. If yes, then increase the current setpoint using p1610.<br>- if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again.<br>- check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.<br>- check whether the motor cables are disconnected (see A07929).<br>If there is no fault, then the fault tolerance can be increased (p1745). |

**F07968 Drive: Lq-Ld measurement incorrect**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred during the Lq-Ld measurement.  
Fault value (r0949, decimal interpretation):  
10: Stage 1: The ratio between the measured current and zero current is too low.  
12: Stage 1: The maximum current was exceeded.  
15: Second harmonic too low.  
16: Drive converter too small for the measuring technique.  
17: Abort due to pulse inhibit.

**Remedy:** For fault value = 10:  
Check whether the motor is correctly connected.  
Replace the power unit involved.  
De-activate technique (p1909).  
For fault value = 12:  
Check whether motor data have been correctly entered.  
De-activate technique (p1909).  
For fault value = 16:  
De-activate technique (p1909).  
For fault value = 17:  
Repeat technique.

---

**F07969 Drive: Incorrect pole position identification**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred during the pole position identification routine.  
Fault value (r0949, decimal interpretation):  
1: Current controller limited  
2: Motor shaft locked.  
10: Stage 1: The ratio between the measured current and zero current is too low.  
11: Stage 2: The ratio between the measured current and zero current is too low.  
12: Stage 1: The maximum current was exceeded.  
13: Stage 2: The maximum current was exceeded.  
14: Current difference to determine the +d axis too low.  
15: Second harmonic too low.  
16: Drive converter too small for the measuring technique.  
17: Abort due to pulse inhibit.  
18: First harmonic too low.  
20: Pole position identification requested with the motor shaft rotating and activated flying restart function.

**Remedy:** For fault value = 1:  
Check whether the motor is correctly connected.  
Check whether motor data have been correctly entered.  
Replace the power unit involved.  
For fault value = 2:  
Bring the motor into a no-load condition.  
For fault value = 10:  
Check whether the motor is correctly connected.  
Replace the power unit involved.  
For fault value = 11:  
Check whether the motor is correctly connected.  
Replace the power unit involved.  
For fault value = 12:  
Check whether motor data have been correctly entered.  
For fault value = 13:  
Check whether motor data have been correctly entered.  
For fault value = 17:  
Repeat technique.  
For fault value = 20:  
Before carrying out a pole position identification routine ensure that the motor shaft is absolutely stationary (zero speed).

---

**F07984 Drive: Speed controller optimization, moment of inertia**

---

**Reaction:** OFF1 (NONE, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred while identifying the moment of inertia.  
Fault value (r0949, decimal interpretation):  
1: The speed did not reach a steady-state condition.  
2: The speed setpoint was not able to be approached as the minimum limiting is active.  
3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.  
4: The speed setpoint was not able to be approached as the maximum limiting is active.  
5: It is not possible to increase the speed by 10% as the minimum limiting is active.  
6: It is not possible to increase the speed by 10% as the suppression (skip) bandwidth is active.  
7: It is not possible to increase the speed by 10% as the maximum limiting is active.  
8: The torque difference after the speed setpoint step is too low in order to be able to still reliably identify the moment of inertia.  
9: Too few data to be able to reliably identify the moment of inertia.  
10: After the setpoint step, the speed either changed too little or in the incorrect direction.  
11: The identified moment of inertia is not plausible.

**Remedy:** For fault value = 1:  
- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.  
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.  
- carry out a motor data identification routine (p1910).  
- if required, reduce the dynamic factor (p1967 < 25 %).  
Re fault value = 2, 5:  
- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).  
Re fault value = 3, 6:  
- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1092, p1101).  
Re fault value = 4, 7:  
- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).  
For fault value = 8:  
- the total drive moment of inertia is far higher than that of the motor (refer to p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.  
For fault value = 9:  
- check the moment of inertia (p0341, p0342). After the change, re-calculate (p0340 = 3 or 4).  
For fault value = 10:  
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.  
**Note:**  
The moment of inertia identification routine can be disabled using p1959.2.

**F30002 Power unit: DC link voltage, overvoltage**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an overvoltage condition in the DC link.

- motor regenerates too much energy.
- line supply voltage too high.
- line phase interrupted.
- DC-link voltage control switched off.
- dynamic response of DC-link voltage controller excessive or insufficient.

Fault value (r0949, decimal interpretation):  
DC link voltage at the time of trip [0.1 V].

**Remedy:**

- increase the ramp-down time (p1121).
- set the rounding times (p1130, p1136). This is particularly recommended in U/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator.
- Activate the DC link voltage controller (p1240, p1280).
- adapt the dynamic response of the DC-link voltage controller (p1243, p1247, p1283, p1287).
- check the line supply voltage and setting in p0210.
- check and correct the phase assignment at the power unit.
- check the line supply phases.

---

**F30003 Power unit: DC link voltage, undervoltage**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line phase interrupted.

**Note:**

The monitoring threshold for the DC link undervoltage is the minimum of the following values:

- for a calculation, refer to p0210.

**Remedy:**

- check the line supply voltage
- check the line supply phases.

---

**F30004 Power unit: Overtemperature heat sink AC inverter**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949):  
Temperature [1 bit = 0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

**Notice:**  
This fault can only be acknowledged after this alarm threshold for alarm A05000 has been undershot.

| <b>Cause:</b>       | <p>Hardware current limit for phase W responded. The pulsing in this phase is inhibited for one pulse period.</p> <ul style="list-style-type: none"> <li>- closed-loop control is incorrectly parameterized.</li> <li>- fault in the motor or in the power cables.</li> <li>- the power cables exceed the maximum permissible length.</li> <li>- motor load too high</li> <li>- power unit defective.</li> </ul> <p>Note:</p> <p>Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.</p> |
| <b>Remedy:</b>      | <ul style="list-style-type: none"> <li>- check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).</li> <li>- check the motor circuit configuration (star-delta)</li> <li>- check the motor load.</li> <li>- check the power cable connections.</li> <li>- check the power cables for short-circuit or ground fault.</li> <li>- check the length of the power cables.</li> </ul>                                                            |

---

**A30034      Power unit: Internal overtemperature**

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The alarm threshold for internal overtemperature has been reached.  
If the temperature inside the unit continues to increase, fault F30036 may be triggered.  
- ambient temperature might be too high.  
- insufficient cooling, fan failure.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Control electronics range.  
Bit 1 = 1: Power electronics range.

**Remedy:** - check the ambient temperature.  
- check the fan for the inside of the unit.

---

**F30035      Power unit: Air intake overtemperature**

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The air intake in the power unit has exceeded the permissible temperature limit.  
For air-cooled power units, the temperature limit is at 55 °C.  
- ambient temperature too high.  
- insufficient cooling, fan failure.  
Fault value (r0949, decimal interpretation):  
Temperature [0.01 °C].

**Remedy:** - check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
Notice:  
This fault can only be acknowledged after this alarm threshold for alarm A05002 has been undershot.

---

**F30036      Power unit: Internal overtemperature**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** For chassis power units, the following applies:  
The temperature inside the drive converter has exceeded the permissible temperature limit.  
- insufficient cooling, fan failure.  
- overload.  
- ambient temperature too high.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Overtemperature in the control electronics range.  
Bit 1 = 1: Overtemperature in the power electronics range.

**Remedy:** - check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
Notice:  
This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

---

**F30037      Power unit: Rectifier overtemperature**

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature in the rectifier of the power unit has exceeded the permissible temperature limit.  
- insufficient cooling, fan failure.  
- overload.  
- ambient temperature too high.  
- line supply phase failure.  
Fault value (r0949, decimal interpretation):  
Temperature [0.01 °C].

**Remedy:** - check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
- check the motor load.  
- check the line supply phases.  
Notice:  
This fault can only be acknowledged after this alarm threshold for alarm A05004 has been undershot.

| <b>Reaction:</b>    | OFF2                                                                                                                                                                                                                                                                          |
| <b>Acknowledge:</b> | IMMEDIATELY                                                                                                                                                                                                                                                                   |
| <b>Cause:</b>       | An overcurrent condition has occurred in the braking chopper.                                                                                                                                                                                                                 |
| <b>Remedy:</b>      | - check whether the braking resistor has a short circuit.<br>- for an external braking resistor, check whether the resistor may have been dimensioned too small.<br>Note:<br>The braking chopper is only enabled again at pulse enable after the fault has been acknowledged. |

**A30920 (F)      Temperature sensor fault**

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When evaluating the temperature sensor, an error occurred.  
 Alarm value (r2124, interpret decimal):  
 1: Wire breakage or sensor not connected (KTY: R > 2120 Ohm).  
 2: Measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm).

**Remedy:** - make sure that the sensor is connected correctly.  
 - replace the sensor.

---

**A30999 (F, N)      Power unit: Unknown alarm**

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An alarm occurred on the power unit that cannot be interpreted by the Control Unit firmware.  
 This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
 Alarm value (r2124, interpret decimal):  
 Alarm number.  
 Note:

If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the power unit by an older firmware version (r0128).  
 - upgrade the firmware on the Control Unit (r0018).
