## Safety Guidelines

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

---

### Danger

indicates that death or severe personal injury **will** result if proper precautions are not taken.

---

---

### Warning

indicates that death or severe personal injury **may** result if proper precautions are not taken.

---

---

### Caution

with a safety alert symbol, indicates that minor personal injury **can** result if proper precautions are not taken.

---

---

### Caution

without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

---

---

### Notice

indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

---

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

## Qualified Personnel

The device/system may only be set up and used in conjunction with this documentation. Commissioning and operation of a device/system may only be performed by **qualified personnel**. Within the context of the safety notes in this documentation qualified persons are defined as persons who are authorized to commission, ground and label devices, systems and circuits in accordance with established safety practices and standards.

## Prescribed Usage of Siemens Products

Note the following:

---

### Warning

This device may only be used for the applications described in the catalog or the technical description and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens.

Correct, reliable operation of the product requires proper transport, storage, positioning and assembly as well as careful operation and maintenance.

---

## 1.1 Introduction to Parameters

### 1.1.1 Explanation of list of parameters

The layout of the parameter description is as follows (example only).

| Index               |                                                          | BICO (if available)          |                                   |
|---------------------|----------------------------------------------------------|------------------------------|-----------------------------------|
| <b>r0068[0...1]</b> | <b>CO: Absolute current actual value / I_act abs val</b> |                              |                                   |
|                     | <b>Access level:</b> 3                                   | <b>Calculated:</b> -         | <b>Data type:</b> FloatingPoint32 |
|                     | <b>Can be changed:</b> -                                 | <b>Scaling:</b> p2002        | <b>Data set:</b> -                |
|                     | <b>Unit group:</b> 6_2                                   | <b>Unit selection:</b> p0505 |                                   |
|                     | <b>Min</b>                                               | <b>Max</b>                   | <b>Factory setting</b>            |
|                     | - [Arms]                                                 | - [Arms]                     | - [Arms]                          |

Fig. 1-1 Read-only parameter

| Index               |                                               | BICO (if available)      |                             |
|---------------------|-----------------------------------------------|--------------------------|-----------------------------|
| <b>p0700[0...n]</b> | <b>Command source selection / Cmd src sel</b> |                          |                             |
| G120C DP            | <b>Access level:</b> 1                        | <b>Calculated:</b> -     | <b>Data type:</b> Integer16 |
|                     | <b>Can be changed:</b> T                      | <b>Scaling:</b> -        | <b>Data set:</b> CDS, p0170 |
|                     | <b>Unit group:-</b>                           | <b>Unit selection:</b> - |                             |
|                     | <b>Min</b>                                    | <b>Max</b>               | <b>Factory setting</b>      |
|                     | 0                                             | 200                      | 0                           |
| G120C variants      |                                               |                          |                             |

Fig. 1-2 Write parameter

#### Parameter number

Indicates the relevant parameter number. The numbers used are 4 to 5-digit numbers. Numbers prefixed with an “r” indicate that the parameter is a “read-only” parameter, which displays a particular value but cannot be changed directly by specifying a different value via this parameter number.

All other parameters are prefixed with a “p”. The values of these parameters can be changed directly in the range indicated by the “Min” and “Max” settings in the header. If these values have a physical unit, it is shown in brackets.

**[index]** indicates that the parameter is an indexed parameter and specifies the range of indices available.

**.0...15** indicates that the parameter has several bits, which can be evaluated or connected individually.

#### G120C variants

Indicates for which G120C variant the parameter is valid. If no G120C variant is listed the parameter is valid for all variants.

### Parameter text (Long name/Short name)

Indicates the name of the relevant parameter.

Certain parameter names include the following abbreviated prefixes: BI, BO, CI, CO and CO/BO followed by a colon.

These abbreviations have the following meanings:

|       |   |                                                                                   |                                                                                                  |
|-------|---|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| BI    | = |  | Binector Input, i.e. parameter selects the source of a binary signal                             |
| BO    | = |  | Binector Output, i.e. parameter connects as a binary signal                                      |
| CI    | = |  | Connector Input, i.e. parameter selects the source of an analog signal                           |
| CO    | = |  | Connector Output, i.e. parameter connects as an analog signal                                    |
| CO/BO | = |  | Connector/Binector Output, i.e. parameter connects as an analog signal and/or as a binary signal |

CoBo.pdf

To make use of BICO you will need access to the full parameter list. At this level many new parameter settings are possible, including BICO functionality. BICO functionality is a different, more flexible way of setting and combining input and output functions.

The BICO system allows complex functions to be programmed. Boolean and mathematical relationships can be set up between inputs (digital, analog, serial etc.) and outputs (inverter current, frequency, analog output, relays, etc.).

At BI and CI parameters the parameter number is specified under Factory setting with which this parameter is connected. In this case the Min and Max values have dashes.

### Access level

Indicates the level of user access. For the parameters there is only one freely accessible access level effective. The parameters with the declaration "Access level 1" to "Access level 3" belong to them. Parameters with "Access level 4" are service parameters and password protected.

## Data type

The data types available are shown in the table below.

Table 1-1 Available data types

| Notation                | Meaning                      |
|-------------------------|------------------------------|
| Unsigned8 (U8)          | 8-bit unsigned               |
| Unsigned16 (U16)        | 16-bit unsigned              |
| Unsigned32 (U32)        | 32-bit unsigned              |
| Integer16 (I16)         | 16-bit integer               |
| Integer32 (I32)         | 32-bit integer               |
| FloatingPoint32 (Float) | 32-bit floating point number |

The information of the data types for binector and connector inputs can be composed of two specifications (discreet by a slash):

- First specification: data type of the parameter
- Second specification: data type of the signal source preferably to be connected (binector or connector output)

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source) the following combinations are possible when creating BICO interconnections:

Table 1-2 Possible combinations of BICO interconnections

|                                       | BICO input parameter   |                        |                              |                     |
|---------------------------------------|------------------------|------------------------|------------------------------|---------------------|
|                                       | CI parameter           |                        |                              | BI parameter        |
| BICO output parameter                 | Unsigned32 / Integer16 | Unsigned32 / Integer32 | Unsigned32 / FloatingPoint32 | Unsigned32 / Binary |
| CO: Unsigned8                         | x                      | x                      | –                            | –                   |
| CO: Unsigned16                        | x                      | x                      | –                            | –                   |
| CO: Unsigned32                        | x                      | x                      | –                            | –                   |
| CO: Integer16                         | x                      | x                      | r2050                        | –                   |
| CO: Integer32                         | x                      | x                      | –                            | –                   |
| CO: FloatingPoint32                   | x                      | x                      | x                            | –                   |
| BO: Unsigned8                         | –                      | –                      | –                            | x                   |

| –: BICO interconnection not permitted |                        |                        |                              |                     |

## Scaling

Specification of the reference value with which a signal value is automatically converted for a BICO interconnection.

Reference quantities, corresponding to 100 %, are required for the statement of physical units as percentages. These reference quantities are entered in parameters p2000 ... p2006.

In addition to p2000 ... p2006 the following scalings are used:

- PERCENT      1.0 = 100 %
- 4000H        4000 hex = 100 %

## Calculated

Specifies whether the parameter is influenced by automatic calculations.

p0340 defines the following calculations:

- p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5.
- p0340 = 2 calculates the motor parameters (p0350 ... p0360, p0625).
- p0340 = 3 contains the calculations of p0340 = 4, 5.
- p0340 = 4 only calculates the controller parameters.
- p0340 = 5 only calculates the controller limits.

---

### Note:

For p3900 > 0, also p0340 = 1 is automatically called.

After p1900 = 1, 2, p0340 = 3 is automatically called.

---

Parameters referring to p0340 in the specification "Calculated" are dependent on the applied Power Module and motor. In this case, the values of "Factory setting" do not correspond to the actual values because these values are calculated during the commissioning. This also applies to the motor parameters.

**Can be changed**

Inverter state in which the parameter is changeable. Three states are possible:

- Commissioning C(x)
- Run U
- Ready to run T

In these states the parameter can be changed. One, two or all three states may be specified. If all three states are specified, it is possible to change the parameter setting in all three inverter states. (x) shows, that the parameter is only changeable when p0010 = x.

**Data Set**

Parameters which are dependent on a data set are identified as follows:

- **CDS (Command Data Set)**

They are always indexed with [0 ... n] (with n = 0 ... 1 depending on setting in p0170).

[0] = Command Data Set 0

[1] = Command Data Set 1

- **DDS (Drive Data Set)**

They are always indexed with [0 ... n] (with n = 0).

[0] = Drive Data Set 0

- **MDS (Motor Data Set) and PDS (Power unit Data Set)**

They are always indexed with [0 ... n] (with n = 0). The Motor Data Sets and Power unit Data Sets are allocated to the Drive Data Sets, i.e. they are automatically addressed with the selection of a Drive Data Set (e.g. Drive Data Set 0 includes Motor Data Set 0 and Power unit Data Set 0).

Data sets can only be applied and cleared when p0010 = 15 is set.

**"Unit group" and "Unit selection"**

For parameters where the unit can be switched, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be switched over.

The standard unit of a parameter is specified in square parentheses after the values for "Min", "Max", and "Factory setting".

**Min**

Indicates the minimum value to which the parameter can be set.

**Max**

Indicates the maximum value to which the parameter can be set.

**Factory setting**

Indicates the default value, i.e. the value which applies if the user does not specify a particular value for the parameter (see also "Calculated").

**Example:**

Unit group: 7\_1, unit selection: p0505

The parameter belongs to unit group 7\_1 and the unit can be switched over using p0505.

All the potential unit groups and possible unit selections are listed below.

Table 1-3 Unit group (p0100)

| Unit group | Unit selection for p0100 = |                    |                  | Reference value<br>at % |
|------------|----------------------------|--------------------|------------------|-------------------------|
|            | 0                          | 1                  | 2                |                         |
| 7_4        | Nm                         | lbf ft             | Nm               | -                       |
| 14_6       | kW                         | HP                 | kW               | -                       |
| 25_1       | kgm <sup>2</sup>           | lb ft <sup>2</sup> | kgm <sup>2</sup> | -                       |
| 27_1       | kg                         | lb                 | kg               | -                       |
| 28_1       | Nm/A                       | lbf ft/A           | Nm/A             | -                       |

Table 1-4 Unit group (p0505)

| Unit group | Unit selection for p0505 = |    |                  |        | Reference value<br>at % |
|------------|----------------------------|----|------------------|--------|-------------------------|

| 21_1       | °C                         | °C | °F               | °F     | -                       |
| 39_1       | 1/s <sup>2</sup>           | %  | 1/s <sup>2</sup> | %      | p2007                   |

Table 1-5 Unit group (p0595)

| Unit group | Unit selection for p0595 =                                                                   |      | Reference value<br>at % |
|------------|----------------------------------------------------------------------------------------------|------|-------------------------|
|            | Value                                                                                        | Unit |                         |
| 9_1        | The values that can be set and the technological units are shown in p0595 (see Chapter 1.2). |      |                         |

**Description**

Explanation of the parameter function.

**Values**

List of possible parameter values.

**Recommendation**

Information about recommended settings.

**Index**

The name and meaning of each individual index is specified for indexed parameters, except indexed parameters which belong to a data set (see "Data Set").

**Bit array**

For parameters with bit arrays, for each bit the following information is provided:

- Bit number and signal name
- Meaning at signal states 0 and 1
- Function diagram (FP) (optional). The signal is shown on this function diagram.

**Dependency**

Conditions which need to be fulfilled with regard to this parameter. Also includes special effects which can occur between this parameter and others.

## 1.1.2 Numerical ranges of parameters

### Note:

The following numerical ranges of the parameters describe a general overview of SINAMICS parameters. The specific parameters are listed in Chapter 1.2.

Table 1-6 Numerical ranges of parameters

| Range |      | Description                                               |
|-------|------|-----------------------------------------------------------|
| from  | to   |                                                           |
| 0000  | 0099 | Operation and visualization                               |
| 0100  | 0199 | Commissioning                                             |
| 0200  | 0299 | Power Module                                              |
| 0300  | 0399 | Motor                                                     |
| 0500  | 0599 | Technology and units                                      |
| 0600  | 0699 | Thermal motor protection and motor model, maximum current |
| 0700  | 0799 | Command sources and terminals on Control Unit             |
| 0800  | 0839 | CDS, DDS data sets (e.g. switch over, copy)               |
| 0840  | 0879 | Sequence control (e.g. source for ON/OFF1)                |
| 0880  | 0899 | Control and status words                                  |
| 0900  | 0999 | PROFIBUS/PROFIdrive                                       |
| 1000  | 1199 | Setpoint channel                                          |
| 1200  | 1299 | Functions (e.g. motor holding brake)                      |
| 1300  | 1399 | V/f control                                               |
| 1400  | 1799 | Closed-loop control                                       |
| 1800  | 1899 | Gating unit                                               |
| 1900  | 1999 | Power Module and motor identification                     |
| 2000  | 2099 | Communication (PROFIBUS)                                  |
| 2100  | 2199 | Faults and alarms, monitoring functions                   |
| 2200  | 2399 | Technology controller                                     |
| 3100  | 3299 | Messages                                                  |
| 3800  | 3860 | Compound braking                                          |
| 3900  | 3999 | Management parameters                                     |
| 7800  | 7899 | EEPROM read/write parameters                              |
| 8500  | 8599 | Data and macro management                                 |
| 8600  | 8799 | CANopen                                                   |
| 8800  | 8899 | PROFIdrive                                                |
| 8900  | 8999 | PROFINET, USB                                             |
| 9400  | 9499 | Parameter consistency and storage                         |
| 9600  | 9899 | Safety Integrated                                         |
| 9900  | 9949 | Topology                                                  |
| 9950  | 9999 | Diagnostics (internal)                                    |

## 1.2 List of Parameters

Product: SINAMICS G120C, Version: 4402100, Language: eng  
Objects: G120C CAN, G120C DP, G120C USS/MB

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                          |                             |

| <b>Dependency:</b>  | <p>The motor utilization is only determined for permanent-magnet synchronous motors and if the I2t motor model is activated.</p> <p>The motor utilization is formed from the ratio between the I2t motor model temperature (minus 40 Kelvin) and the reference value p0605 (motor overtemperature, fault threshold) - 40 Kelvin. If p0605 is reduced, r0034 increases and the motor temperature remains the same.</p> <p>Refer to: p0611, p0615</p>                                                                                                                                                                                                                                                                                                                                                                       |                                                                               |                                                         |
| <b>Note:</b>        | <p>Smoothing time constant = 100 ms</p> <p>The signal is not suitable as a process quantity and may only be used as a display quantity.</p> <p>A value of r0034 = -200.0 % indicates an invalid display, for example, because the thermal I2t motor model was not activated or was incorrectly parameterized.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                               |                                                         |

| <b>Dependency:</b>  | Refer to: r0002                                                                                            |                                        |                              |                 |           |

- Note:** The value r0046 = 0 indicates that all enable signals for this drive are present.
- Bit 00 = 1 (enable signal missing), if:
- the signal source in p0840 is a 0 signal.
  - there is a "switching on inhibited".
- Bit 01 = 1 (enable signal missing), if:
- the signal source in p0844 or p0845 is a 0 signal.
- Bit 02 = 1 (enable signal missing), if:
- the signal source in p0848 or p0849 is a 0 signal.
- Bit 03 = 1 (enable signal missing), if:
- the signal source in p0852 is a 0 signal.
- Bit 04 = 1 (DC brake active) when:
- the signal source in p1230 has a 1 signal
- Bit 10 = 1 (enable signal missing), if:
- the signal source in p1140 is a 0 signal.
- Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:
- the signal source in p1141 is a 0 signal.
  - the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.
- Bit 12 = 1 (enable signal missing), if:
- the signal source in p1142 is a 0 signal.
- Bit 16 = 1 (enable signal missing), if:
- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.
- Bit 17 = 1 (enable signal missing), if:
- commissioning mode is selected (p0010 > 0).
  - there is an OFF2 fault response.
  - the drive is not operational.
- Bit 18 = 1 (enable signal missing), if:
- OFF3 has still not been completed or an OFF3 fault response is present.
- Bit 19 = 1 (internal pulse enable missing), if:
- sequence control does not have a finished message.
- Bit 20 = 1 (internal DC brake active), if:
- the drive is not in the state "Operation" or in "OFF1/3".
  - the internal pulse enable is missing (r0046.19 = 0).
- Bit 21 = 1 (enable signal missing), if:
- the power unit does not issue an enable signal (e.g. because DC link voltage is too low).
  - the holding brake opening time (p1216) has still not expired.
  - hibernation is active.
- Bit 26 = 1 (enable signal missing), if:
- the drive is not operational.
- Bit 27 = 1 (enable signal missing), if:
- de-magnetization not completed.
- Bit 28 = 1 (enable signal missing), if:
- the holding brake is closed or has still not been opened.
- Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:
- the pole position identification is active.
  - motor data identification is active (only certain steps).
- Bit 31 = 1 (enable signal missing), if:
- the speed setpoint from jog 1 or 2 is entered.

| <b>Note:</b>        | For space vector modulation, 100% corresponds to the maximum output voltage without overcontrol. Values above 100 % indicate an overcontrol condition - values below 100% have no overcontrol. The phase voltage (phase-to-phase, rms) is calculated as follows: $(r0074 \times r0070) / (\sqrt{2} \times 100 \%)$ . The modulation depth is available smoothed (r0028) and unsmoothed (r0074). |                              |                                    |

| <b>Description:</b> | Enter the inductance of a filter connected at the power unit output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                             |                                      |
| <b>Dependency:</b>  | This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.<br>Refer to: p0230                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                             |                                      |
| <b>Note:</b>        | When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out.<br>The parameter cannot be changed if the power unit has an internal sine-wave filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                             |                                      |

| <b>Description:</b> | Enters the capacitance of a sine-wave filter connected at the power unit output.                                                                                                                                                                                                                                                                                                                                                                                                    |                             |                                                       |
| <b>Dependency:</b>  | This parameter is automatically pre-set when you select a filter via p0230 if a SIEMENS filter is defined for the power unit.<br>Refer to: p0230                                                                                                                                                                                                                                                                                                                                    |                             |                                                       |
| <b>Note:</b>        | The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground).<br>When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0).<br>The parameter cannot be changed if the power unit has an internal sine-wave filter. |                             |                                                       |

| <b>Description:</b> | Sets the excitation build-up time of the motor.<br>This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                |                                         |
| <b>Caution:</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                |                                         |
| <b>Note:</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                |                                         |
|                     | If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note).<br><br>The parameter is calculated using p0340 = 1, 3.<br>For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384).<br>For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled. |                                |                                         |

**Description:**

Selects the units for the parameters of the technology controller.

**Value:**

- 1: %
- 2: 1 referred, no dimensions
- 3: bar
- 4: °C
- 5: Pa
- 6: ltr/s
- 7: m³/s
- 8: ltr/min
- 9: m³/min
- 10: ltr/h
- 11: m³/h
- 12: kg/s
- 13: kg/min
- 14: kg/h
- 15: t/min
- 16: t/h
- 17: N
- 18: kN
- 19: Nm
- 20: psi
- 21: °F
- 22: gallon/s
- 23: inch³/s
- 24: gallon/min
- 25: inch³/min
- 26: gallon/h
- 27: inch³/h
- 28: lb/s
- 29: lb/min
- 30: lb/h
- 31: lbf
- 32: lbf ft
- 33: K
- 34: rpm
- 35: parts/min
- 36: m/s
- 37: ft³/s
- 38: ft³/min
- 39: BTU/min
- 40: BTU/h
- 41: mbar
- 42: inch wg
- 43: ft wg
- 44: m wg
- 45: % r.h.
- 46: g/kg

**Dependency:**

Only units of parameters with unit group 9\_1 can be changed over using this parameter.

| <b>Value:</b>       | 0: No sensor<br>1: PTC alarm & timer<br>2: KTY84<br>4: Bimetallic NC contact alarm & timer                                                                                                                                                                                                                                                                                                                                              |                              |                                      |
| <b>Caution:</b>     |  If, for a selected KTY temperature sensor (p0601 = 2), the motor temperature sensor is not connected but another encoder, then the temperature adaptation of the motor resistances must be switched out (p0620 = 0). Otherwise, in controlled-loop operation, torque errors will occur that will mean that the drive will not be able to be stopped. |                              |                                      |
| <b>Note:</b>        | PTC thermistor (p0601 = 1): Tripping resistance = 1650 Ohm.                                                                                                                                                                                                                                                                                                                                                                             |                              |                                      |

| <b>Description:</b> | Selects the identification of the stator resistance after booting the Control Unit (only for vector control).<br>The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model.<br>p0621 = 1:<br>Identification of the stator resistance only when the drive is powered up for the first time (pulse enable) after booting the Control Unit.<br>p0621 = 2:<br>Identification of the stator resistance every time the drive is powered up (pulse enable). |                              |                             |
| <b>Value:</b>       | 0: No Rs identification<br>1: Rs identification after switching-on again<br>2: Rs identification after switching-on each time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |                             |
| <b>Dependency:</b>  | - perform motor data identification (see p1910) with cold motor.<br>- enter ambient temperature at time of motor data identification in p0625.<br>Refer to: p0622, r0623                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                              |                             |
| <b>Notice:</b>      | The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.<br>Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.                                                                                                                                                                                                                                                              |                              |                             |
| <b>Note:</b>        | The measurement is carried out:<br>- For induction motors<br>- When vector control is active (see p1300)<br>- If a temperature sensor (KTY) has not been connected<br>- When the motor is at a standstill when switched on<br>When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure).<br>If identification is activated, the magnetizing time is determined via p0622 and not via p0346. The speed is enabled after completion of the measurement.                                                                            |                              |                             |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                |                                     |

| <b>Note:</b>        | <p>For p0622 &lt; p0346 the following applies:</p> <p>If identification is activated, the magnetizing time is influenced by p0622. The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current.</p> <p>For p0622 &gt;= p0346 the following applies:</p> <p>Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. The entire measurement period (magnetizing plus measurement settling time plus measuring time) will always be greater than p0346.</p> |                                |                                     |

| <b>Description:</b> | The non-linear and cross-coupled quadrature axis flux functions are defined using 4 coefficients.<br>This parameter describes the gradients of the saturated component over the quadrature axis current.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                               |                                       |

| <b>Note:</b>        | <p>The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305. The current limit p0640 is limited to r0209.</p> <p>The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the power unit.</p> <p>The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 &gt; 0 or using the automatic parameterization with p0340 = 3, 5. p0640 is limited to 4.0 x p0305.</p> <p>p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 x p0305, with p0305 = r0207[1]). p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 &gt; 0).</p> |                               |                                       |

**Description:** Sets the scaling characteristic for the analog inputs.  
The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the x coordinate (V, mA) of the 1st value pair of the characteristic.

**Index:**  
[0] = AI0 (T. 3/4)  
[1] = AI1 (T. 10/11)

**Note:** The parameters for the characteristic do not have a limiting effect.

The scaling characteristic for the analog inputs is defined using 2 points.  
This parameter specifies the y coordinate (percentage) of the 2nd value pair of the characteristic.

**Index:**  
[0] = AI0 (T. 3/4)  
[1] = AI1 (T. 10/11)

**Note:** The parameters for the characteristic do not have a limiting effect.

Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.<br/>After communications have been established, check the reset operation (refer below).</p> <p>If value = 3:<br/>The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.<br/>If the cyclic communication is active for both PROFIdrive interfaces, then the reset is executed after completing both cycle communications.<br/>After communications have been established, check the reset operation (refer below).<br/>To check the reset operation:<br/>After the drive unit has been restarted and communications have been established, read p0972 and check the following:<br/>p0972 = 0? --&gt; The reset was successfully executed.<br/>p0972 &gt; 0? --&gt; The reset was not executed.</p> |                          |                              |

| <b>Notice:</b>      | For p0014 = 1, the following applies:<br>After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                |                              |                 |           |
| <b>Note:</b>        | Re bit 00:<br>0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.<br>1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.<br>Re bit 01:<br>0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).<br>1: With ramp-function generator in the automatic mode.<br>For manual operation, the ramp-function generator is always active.<br>Re bit 02:<br>0: Without initial rounding-off<br>1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).<br>The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:<br>$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$<br>The jerk acts up until the maximum acceleration is reached ( $a_{max} = p1082 [1/s] / p1047 [s]$ ), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.<br>Re bit 03:<br>0: Non-volatile data save de-activated.<br>1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).<br>Re bit 04:<br>When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r1050. |                                                |                              |                 |           |

|                     |                                                                                                                                                                                                                                     |                          |                                |  |

| <b>Notice:</b>      | After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                |                                            |
| <b>Note:</b>        | <p>The parameter applies for both motor directions. The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer).</p> <p>Since the parameter is part of quick commissioning (p0010 = 1), it is defined appropriately when p0310, p0311, and p0322 are changed.</p> <p>The following limits are always effective for p1082:</p> $p1082 \leq 60 \times \text{maximum}(15 \times r0310, 650 \text{ Hz}) / \text{pole pair number}$ $p1082 \leq 60 \times \text{maximum power unit pulse frequency} / (k \times \text{pole pair number}), \text{ with } k = 12 \text{ (vector control)}, k = 6.5 \text{ (U/f control)}$ <p>If a sine-wave filter (p0230 = 3) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). For reactors and dU/dt filters, it is limited to 120 Hz / pole pair number.</p> <p>During automatic calculation (p0340 = 1, p3900 &gt; 0), the parameter value is assigned the maximum motor speed (p0322). If p0322 = 0, the rated motor speed (p0311) is used as default (pre-assignment) value. For induction motors, the synchronous no-load speed is used as the default value (p0310 x 60 / pole pair number).</p> <p>For synchronous motors, the following additionally applies:</p> <p>During automatic calculation (p0340, p3900), p1082 is limited to speeds where the EMF does not exceed the DC link voltage.</p> <p>p1082 is also available in the quick commissioning (p0010 = 1); this means that when exiting via p3900 &gt; 0, the value is not changed.</p> <p>For vector control, the maximum speed is restricted to 60.0 / (8.333 x 500 μs x pole pair number). This can be identified by a reduction in r1084. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.</p> <p>When using sine-wave filters (p0230 = 3, 4), the maximum speed r1084 is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.</p> |                                |                                            |
| <b>p1083[0...n]</b> | <b>CO: Speed limit in positive direction of rotation / n_limit pos</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                |                                            |

| <b>Caution:</b> If the technology controller is being used as the speed main setpoint (p2251 = 0), do not invert the setpoint using p1113 when the technology controller is enabled because this can cause the speed to change suddenly and lead to positive couplings in the control loop. |                          |                              |                                                |

| <b>Caution:</b> If the technology controller is being used as the speed main setpoint (p2251 = 0), do not invert the setpoint using p1113 when the technology controller is enabled because this can cause the speed to change suddenly and lead to positive couplings in the control loop. |                          |                              |                                                |

| <b>Description:</b> | The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.                                                                                                                                                                                                                                           |                              |                                      |
| <b>Dependency:</b>  | Refer to: p1082                                                                                                                                                                                                                                                                                                                                                                |                              |                                      |
| <b>Note:</b>        | The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized.<br>For U/f control and sensorless vector control (see p1300), ramp-up times of 0 s are not expedient. The setting should be based on the startup times (r0345) of the motor. |                              |                                      |

**Can be changed:** T**Scaling:** -**Data set:** CDS, p0170**Units group:** -**Unit selection:** -**Min****Max****Factory setting**

-

-

1

**Description:**

Sets the signal source for the command "enable ramp-function generator/inhibit ramp-function generator".

For the PROFIdrive profile, this command corresponds to control word 1 bit 4 (STW1.4).

BI: p1140 = 0 signal:

Inhibits the ramp-function generator (the ramp-function generator output is set to zero).

BI: p1140 = 1 signal:

Enables the ramp-function generator.

**Dependency:**

Refer to: r0054, p1141, p1142

**Caution:**

When "master control from PC" is activated, this binector input is ineffective.

**Notice:**

The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

| <b>Description:</b> | Sets the operating mode for flying restart.<br>The flying restart allows the drive converter to be powered up while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.                                                                                                                                                                                                                                                                                                                                                                 |                          |                                |

| <b>Dependency:</b>  | For synchronous motors, flying restart cannot be activated.<br>Refer to: p1201<br>Refer to: F07330, F07331                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                          |                                |
| <b>Notice:</b>      | The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                          |                                |
| <b>Note:</b>        | When p1200 = 1, 4: Flying restart is active after faults, OFF1, OFF2, OFF3.<br>When p1200 = 1: The search is made in both directions.<br>When p1200 = 4: The search is only made in the setpoint direction.<br>For U/f control (p1300 < 20), the following applies:<br>The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill.<br>If p1200 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300). |                          |                                |

| <b>Description:</b> | Sets the automatic restart mode (AR).<br>The parameters must be saved in the non-volatile memory p0971 = 1 in order that the setting becomes effective.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                          |                             |
| <b>Value:</b>       | 0: Inhibit automatic restart<br>1: Acknowledge all faults without restarting<br>4: Restart after line supply failure w/o additional start attempts<br>6: Restart after fault with additional start attempts<br>14: Restart after line supply failure following man. acknowledgment<br>16: Restart after fault following manual acknowledgment<br>26: Acknowledging all faults and reclosing for an ON command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                          |                             |
| <b>Dependency:</b>  | The automatic restart requires an active ON command (e.g., via a digital input). If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted.<br>When using an Operator Panel in the LOCAL mode, then there is no automatic start.<br>For p1210 = 14, 16, a manual acknowledgement is required for an automatic restart.<br>For p1210 = 26, the ON command can also be entered with a delay. After the line supply returns or acknowledging a fault, the restart waits for an ON command. The maximum wait time is specified using p1213[0].<br>Refer to: p0840<br>Refer to: F30003                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                          |                             |
| <b>Danger:</b>      |  If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is present again. This automatic power-up sequence can only be interrupted by withdrawing the ON command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                          |                             |
| <b>Caution:</b>     | A change is only accepted and made in the state "initialization" and "wait for alarm". When faults are present, therefore, the parameter cannot be changed.<br>For p1210 > 1, the motor is automatically started.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                          |                             |
| <b>Note:</b>        | Re p1210 = 1:<br>Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. p1211 has no influence on the number of acknowledgment attempts.<br>Re p1210 = 4:<br>An automatic restart is only performed if fault F30003 has occurred on the power unit. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.<br>Re p1210 = 6:<br>An automatic restart is carried out if any fault has occurred.<br>Re p1210 = 14:<br>As for p1210 = 4. However, faults that are present must be manually acknowledged.<br>Re p1210 = 16:<br>As for p1210 = 6. However, faults that are present must be manually acknowledged.<br>Re p1210 = 26:<br>As for p1210 = 6. However, at the time that the fault is acknowledged or at power on, a switch-on command is not necessary. This can be set with a time delay. The drive is switched-on again as soon as the switch-on command is set. The restart can be interrupted with either OFF2 or OFF3. |                          |                             |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                          |                                   |

| <b>Caution:</b>     | A change is only accepted and made in the state "initialization" and "wait for alarm".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                          |                                   |
| <b>Notice:</b>      | After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.<br>After a complete power failure the start counter always starts with the counter value that applied before the power failure, and decrements this start attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to power failure, e.g. when the CU remains active on power failure longer than the time p1212 / 2, the fault counter will already have been decremented once. In this case, the start counter is thus decreased by the value 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                          |                                   |
| <b>Note:</b>        | A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized ( $r0056.4 = 1$ ) and an additional delay time of 1 s has expired.<br>As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning.<br>Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available.<br>At least one start attempt is always carried out.<br>After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented.<br>For p1210 = 26, the start counter is decremented if after a successful fault acknowledgement, the on command is present. |                          |                                   |

| <b>Notice:</b>      | After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is re-activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                          |                                   |
| <b>Note:</b>        | <p>Index 0:</p> <p>The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output. The monitoring is de-activated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart. The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present). In the case of p1210 = 14, 16, the faults which are present must be acknowledged manually within the time in p1213 index 0. Otherwise, fault F07320 is generated after the set time.</p> <p>Index 1:</p> <p>The start counter is only reset to the starting value p1211 if, after successful restart, the time in p1213 index 1 has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The start counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged. The start counter is immediately updated if the starting value p1211 or the mode p1210 is changed. For p1210 = 26, the fault must have been successfully acknowledged and the switch-on command issued within the time in p1213, index 0. Otherwise, fault F07320 is generated after the set time.</p> |                          |                                   |

| <b>Caution:</b>     | For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                          |                                   |
| <b>Notice:</b>      | If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                          |                                   |
| <b>Note:</b>        | <p>If a holding brake integrated in the motor is used, then it is not permissible that p1215 is set to 3.</p> <p>if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal.</p> <p>The parameter can only be set to zero when the pulses are inhibited.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                          |                                   |

| <b>Description:</b> | Sets the time to apply the motor holding brake.<br>After OFF1 or OFF3 and the controlling (closing) of the holding brake, the drive remains stationary under closed-loop control for this time with a speed setpoint of zero. The pulses are suppressed when the time expires.                         |                          |                                    |
| <b>Dependency:</b>  | Refer to: p1215, p1216                                                                                                                                                                                                                                                                                 |                          |                                    |
| <b>Notice:</b>      | If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag.<br>If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime. |                          |                                    |

| <b>Note:</b>                                                | <p>The function is activated as soon as the activation criterion is fulfilled.</p> <ul style="list-style-type: none"> <li>- the function can be initiated by an OFF2 response.</li> </ul> <p>Activation criterion (one of the following criteria is fulfilled):</p> <ul style="list-style-type: none"> <li>- binector input p1230 = 1 signal (DC braking activation).</li> <li>- the drive is not in the state "S4: Operation" or in "S5x" (refer to function chart 2610).</li> <li>- the internal pulse enable is missing (r0046.19 = 0).</li> </ul> <p>The function can only be used for induction motors (p0300 = 1).</p> <p>DC braking can only be withdrawn (p1231 = 0) if it is not being used as a fault response in p2101.</p> <p>Re p1231 = 5:</p> <p>DC braking can only be set for induction motors.</p> <p>DC braking is activated if the OFF1 or OFF3 command is present. Binector input p1230 is ineffective. If the drive speed still lies above the speed threshold p1234, then initially, the drive is ramped-down to this threshold, demagnetized (see p0347) and is then switched into DC braking for the time set in p1233. After this, the drive is switched-off. If, at OFF1, the drive speed is below p1234, then it is immediately demagnetized and switched into DC braking. A change is made into normal operation if the OFF1 command is withdrawn prematurely. Flying restart must be activated if the motor is still rotating.</p> <p>DC braking by means of fault response continues to be possible.</p> <p>Re p1231 = 14:</p> <p>In addition to the function for p1231 = 5, binector input p1230 is evaluated.</p> <p>DC braking is only automatically activated when the speed threshold p1234 is fallen below if binector input p1230 = 1 signal.</p> <p>Notice:</p> <p>This is also the case, if no OFF command is present. After demagnetization and after the time in p1233 has expired, the drive changes back into normal operation or is switched-off (for OFF1/OFF3).</p> <p>If a 0 signal is applied to binector input p1230, for OFF1 and OFF3 no DC braking is executed.</p> <p>Note:</p> <p>DCBRK: DC Braking</p> |                          |                             |

| Description: | Sets the braking current for DC braking.                                                                                                                                                                                                                         |                                           |                       |                            |      |
| Dependency:  | Refer to: p1230, p1231, p1233, p1234, r1239, p1345, p1346                                                                                                                                                                                                        |                                           |                       |                            |      |
| Note:        | A change to the braking current becomes effective the next time that DC braking is switched-on.                                                                                                                                                                  |                                           |                       |                            |      |
|              | The value for p1232 is specified as an rms value in the 3-phase system. The magnitude of the braking current is the same as that of an identical output current at frequency zero (see r0067, r0068, p0640). The braking current is internally limited to r0067. |                                           |                       |                            |      |
|              | For vector control, a current value of 1.4142 x p1232 is obtained in the output phase U. For U/f control, the phase angle is offset by -30 degrees to obtain a current measurement of 1.2247 x p1232 in output phase U.                                          |                                           |                       |                            |      |
|              | For the current controller, the settings of parameters p1345 and p1346 (I_max limiting controller) are used.                                                                                                                                                     |                                           |                       |                            |      |
|              |                                                                                                                                                                                                                                                                  |                                           |                       |                            |      |
| p1233[0...n] | DC braking time / DCBRK time                                                                                                                                                                                                                                     |                                           |                       |                            |      |

| <b>Description:</b> | Sets the dynamic factor for the DC link voltage controller (Vdc_max controller).<br>100% means that p1250, p1251, and p1252 (gain, integral time, and rate time) are used corresponding to their basic settings and based on a theoretical controller optimization.<br>If subsequent optimization is required, this can be carried out using the dynamic factor. In this case p1250, p1251, p1252 are weighted with the dynamic factor p1243.                                                                                                                                                                                                                                                     |                                  |                                   |

| Description: | Sets the lower speed threshold for the Vdc_max controller. When this speed threshold is undershot, the Vdc_max control is switched out and the speed is controlled using the ramp-function generator.                                                                                                                             |                        |                                |
| Note:        | For fast braking where the ramp-function generator tracking was active, it is possible to prevent the drive rotating in the opposite direction by increasing the speed threshold and setting a final rounding-off time in the ramp-function generator (p1131). This is supported using a dynamic setting of the speed controller. |                        |                                |

| <b>Dependency:</b>  | Only operation with U/f characteristic is possible if the rated motor speed is not entered (p0311).<br>Operation with a U/f characteristic is not supported for 1LE4 synchronous motors.<br>Refer to: p0300, p0311, p0500                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                          |                                    |
| <b>Notice:</b>      | Active slip compensation is required in the U/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%).<br>The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                          |                                    |
| <b>Note:</b>        | For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I <sub>max</sub> frequency controller are switched off internally so that the output frequency can be set precisely. The I <sub>max</sub> voltage controller remains active.<br>During operation (the pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                          |                                    |

| <b>Description:</b> | Defines the voltage boost as a [%] referred to the rated motor current (p0305).<br>The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present.<br>The magnitude of the boost in Volt at a frequency of zero is defined as follows:<br>$\text{Voltage boost [V]} = 1.732 \times p0305 (\text{rated motor current [A]}) \times r0395 (\text{stator/primary section resistance [ohm]}) \times p1310 (\text{permanent voltage boost [\%]}) / 100 \%$<br>At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following: <ul style="list-style-type: none"> <li>- magnetize the induction motor.</li> <li>- hold the load.</li> <li>- compensate for losses in the system.</li> </ul> This is the reason that the output voltage can be increased using p1310.<br>The voltage boost can be used for both linear as well as square-law U/f characteristics. |                          |                                    |
| <b>Dependency:</b>  | The current limit p0640 limits the boost.<br>For vector control, the permanent voltage boost (p1310) has no effect as the drive converter automatically sets the optimum operating conditions.<br>Refer to: p1300, p1311, p1312, r1315                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                          |                                    |
| <b>Notice:</b>      | The voltage boost increases the motor temperature (particularly at zero speed).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                          |                                    |
| <b>Note:</b>        | The voltage boost is only effective for U/f control (p1300).<br>The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)).<br>However, these parameters are assigned the following priorities: p1310 > p1311, p1312                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                          |                                    |

| <b>Description:</b> | The programmable characteristic for the U/f control is defined using 4 points and 0 Hz/p1310. This parameter specifies the frequency of the fourth point along the characteristic.                                                                                                                                                                                    |                                |                                      |
| <b>Dependency:</b>  | Selects the freely programmable characteristic using p1300 = 3.<br>The following applies for the frequency values:<br>p1320 ≤ p1322 ≤ p1324 ≤ p1326<br>Otherwise, a standard characteristic is used that contains the rated motor operating point.<br>Refer to: p1310, p1311, p1320, p1321, p1322, p1323, p1324, p1325, p1327                                         |                                |                                      |
| <b>Note:</b>        | Linear interpolation is carried out between the points 0 Hz/p1310, p1320/p1321 ... p1326/p1327. For output frequencies above p1326, the characteristic is extrapolated with the gradient between the characteristic points p1324/p1325 and p1326/p1327.<br>The voltage boost when accelerating (p1311) is also applied to the freely programmable U/f characteristic. |                                |                                      |

| <b>Description:</b> | Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip).<br>p1335 = 0.0 %: Slip compensation de-activated.<br>p1335 = 100.0 %: The slip is completely compensated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                              |                                         |
| <b>Dependency:</b>  | Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360).<br>If the parameters are not precisely known, a precise compensation can be achieved by varying p1335.<br>For U/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |                                         |
| <b>Note:</b>        | The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors.<br>For synchronous motors, this effect does not occur and the parameter has no effect in this case.<br>For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency.<br>If p1335 is changed during commissioning (p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300). |                              |                                         |

| <b>Description:</b> | Sets the proportional gain of the I_max voltage controller.<br><br>The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the U/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time). |                                  |                                   |
| <b>Dependency:</b>  | In the U/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                  |                                   |
| <b>Notice:</b>      | When de-activating the I_max controller, the following must be carefully observed:<br><br>When the maximum current (r0067) is exceeded, the output current is no longer reduced, however, overcurrent alarm messages are generated. The drive is shut down if the overcurrent limit (r0209) is exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                  |                                   |
| <b>Note:</b>        | p1341 = 0: I_max frequency controller de-activated and I_max voltage controller activated over the complete speed range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                  |                                   |
