

FLS3217 / FLS3247

Single-Stage PFC Primary-Side-Regulation Offline LED Driver with Integrated Power MOSFET

Features

- Cost-Effective Solution without Input Bulk Capacitor and Feedback Circuitry
- Power-Factor Correction (PFC)
- Integrated Power MOSFET
- Accurate Constant-Current (CC) Control Independent Online Voltage, Output Voltage, and Magnetizing Inductance Variation
- Linear Frequency Control for Increased Efficiency
- Open / Short-LED Protection
- Cycle-by-Cycle Current Limiting
- Over-Temperature Protection with Auto Restart
- Low Startup Current: 20μA
- Low Operating Current: 5mA
- V_{DD} Over-Voltage Protection (OVP)
- V_{DD} Under-Voltage Lockout (UVLO)
- Application Voltage Range: 80V_{AC} ~ 308V_{AC}

Description

This highly integrated PWM controller with power MOSFET, FLS3217 / FLS3247, provides several features to enhance the performance of low-power flyback converters. The proprietary topology enables simplified circuit design for LED lighting applications.

By using the single-stage topology with primary-side regulation, an LED lighting board can be implemented with the few external components and minimized cost; requiring no input bulk capacitor or feedback circuitry. To implement good power factor and low THD, constant on-time control is utilized with an external capacitor connected to COM1.

Precise constant-current control regulates accurate output current versus changes in input voltage and output voltage. The operating frequency is proportionally changed by the output voltage to guarantee DCM operation with higher efficiency and simple design.

FLS3217 and FLS3247 provide protection features such as open-LED, short-LED, and over-temperature protection. The current-limit level is automatically reduced to minimize the output current and protect external components in short-LED condition.

Applications

- LED Lighting System

Ordering Information

Part Number	Operating Temperature Range	Package	Packing Method
FLS3217M	-40°C to +125°C	7-Lead, Small Outline Package (SOIC)	Tape & Reel
FLS3217N		7-Lead, Small Outline Package (DIP)	Tube

Pin Configuration

Figure 4. Pin Configuration

Pin Definitions

Pin #	Name	Description
1	CS	Current Sense. This pin connects a current-sense resistor to detect the MOSFET current for the output-current regulation in Constant-Current (CC) regulation.
2	VDD	Power Supply. IC operating current and MOSFET driving current are supplied using this pin.
3	GND	Ground
4	VS	Voltage Sense. This pin detects the output voltage information and discharge time for maximum frequency control and constant current regulation. This pin is connected to an auxiliary winding of the transformer via resistors of the divider.
5	COMI	Constant Current Loop Compensation. This pin is connected to a capacitor between the COMI and GND pins for compensation current loop gain.
6	NC	No Connect
7	DRAIN	Power MOSFET Drain. This pin is the high-voltage power MOSFET drain.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter		Min.	Max.	Unit
V _{VDD}	DC Supply Voltage ^(1,2)			30	V
V _{VS}	VS Pin Input Voltage		-0.3	7.0	V
V _{CS}	CS Pin Input Voltage		-0.3	7.0	V
V _{COMI}	COMI Pin Input Voltage		-0.3	7.0	V

		T _A =25°C, FLS3247N		4	
I _{DM}	Pulsed Drain Current	FLS3217M/N		4	A
		FLS3247N		16	
I _{AR}	Avalanche Current	FLS3217M/N	-	1	A
		FLS3247N		4	
P _D	Power Dissipation	SOIC, T _A < 50°C		660	mW
		DIP, T _A < 50°C		1	W
Θ _{JA}	Thermal Resistance (Junction-to-Air)	SOIC, T _A < 50°C		150	°C/W
		DIP, T _A < 50°C		95	
Θ _{JC}	Thermal Resistance (Junction-to-Case)	SOIC, T _A < 50°C		40	°C/W
		DIP, T _A < 50°C		25	
T _J	Maximum Junction Temperature			+150	°C
T _{STG}	Storage Temperature Range		-55	+150	°C
T _L	Lead Temperature (Soldering 10 seconds)			+260	°C
ESD	ESD Capability, Human Body Model			5	V
	ESD Capability, Charged Device Model			2	

Notes:

1. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device.
2. All voltage values, except differential voltages, are given with respect to GND pin.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Functional Description

FLS3217 / FLS3247 is an AC-DC PWM controller for LED lighting applications. TRUECURRENT® techniques regulate accurate LED current independent of input voltage, output voltage, and magnetizing inductance variations. The linear frequency control in the oscillator reduces conduction loss and maintains DCM operation in the wide range of output voltage, which implements high power factor correction in a single-stage flyback topology. A variety of protections, such as short/open-LED protection, over-temperature protection, and cycle-by-cycle current limitation stabilize system operation and protect external components.

Startup

Powering at startup is slow due to the low feedback-loop bandwidth in the PFC converter. To increase power during startup, the internal oscillator counts 12ms to define Startup Mode. During Startup Mode, turn-on time is determined by current-mode control with 0.2V voltage limit. Transconductance becomes 14 times bigger, as shown in Figure 15. After Startup Mode, turn-on time is controlled by Voltage Mode, using the COM1 voltage. The error amplifier transconductance is reduced to 85μmho.

Figure 15. Startup Sequence

Constant Current Regulation

The output current can be estimated using the peak drain current and inductor current discharge time because output current is same as the average of the diode current in steady state. The peak value of the drain current is determined by the CS pin and the inductor discharge time (t_{DIS}) is sensed by t_{DIS} detector. By using three pieces of information (peak drain current, inductor discharging time, and operating switching period); the TRUECURRENT block calculates estimates the output current. The output of the TRUECURRENT calculation is compared with an internal precise reference to generate an error voltage, V_{COM1} , which determines the turn-on time in Voltage-Mode control. With Fairchild's innovative technique, constant current output can be precisely controlled.

Power-Factor Controller (PFC) and Total Harmonic Distortion (THD)

In a conventional boost converter, Boundary Conduction Mode (BCM) is generally used to keep input current in phase with input voltage for Power Factor (PF) and Total Harmonic Distortion (THD). In flyback / buck boost topology, constant turn-on time and constant frequency / Discontinuous Conduction Mode (DCM) can implement high PF and low THD as shown in Figure 16. Constant turn-on time is maintained by the internal error amplifier and a large external capacitor (typically over 1μF) at the COM1 pin. Constant frequency and DCM operation is managed by linear frequency control.

Figure 16. Input Current and Switching

Linear Frequency Control

DCM should be guaranteed for high power factor in flyback topology. To maintain DCM in the wide range of output voltage, frequency is linearly changed by output voltage in linear frequency control. Output voltage is detected by auxiliary winding and a resistive divider connected to the VS pin, as shown in Figure 17.

Figure 17. Linear Frequency Control

When the output voltage decreases, the secondary diode conduction time is increased and the linear frequency control lengthens the switching period. This maintains DCM operation in the wide output voltage range, as shown in Figure 18. The frequency control also lowers primary rms current with better power efficiency in full-load condition.

Figure 18. Primary and Secondary Current

BCM Control

The end of secondary diode conduction time is possibly over a switching period set by linear frequency control. In this case, FLS3217 and FLS3247 don't allow CCM and the operation mode changes from DCM to BCM. Therefore, FLS3217 and FLS3247 eliminate sub-harmonic distortion in CCM.

Short-LED Protection

In the event of a short LED condition, the switching MOSFET and secondary diode are usually stressed by the high-power current. However, FLS3217 and FLS3247 change OCP level in short-LED condition. When V_S is lower than 0.4V, the OCP level lowers to 0.2V from 0.7V, as shown in Figure 17. Power is limited and external component current stress is relieved.

Figure 19. Internal OCP Block

Figure 20 shows operational waveforms at short-LED condition. Output voltage is quickly lowered to 0V after the LED-short event. Then the reflected auxiliary voltage is also 0V, making V_S less than 0.4V. 0.2V OCP level limits the primary-side current and V_{DD} "hiccup" up and down in between UVLO hysteresis.

Figure 20. Waveforms at Short-LED Condition

Open LED Protection

FLS3217 and FLS3247 protect external components, such as diode and capacitor, at secondary side in open-LED condition. During switch-off, the V_{DD} capacitor is charged up to the auxiliary winding voltage, which is applied as the reflected output voltage. Because the V_{DD} voltage has output voltage information, the internal voltage comparator on the V_{DD} pin can trigger output over-voltage protection (OVP), as shown in Figure 21. When at least one LED is open-circuited, output load impedance becomes very high and the output capacitor is quickly charged up to $V_{OVP} \times N_s / N_a$. Then switching is shutdown and V_{DD} block goes into "Hiccup Mode" until the open-LED condition is removed, shown in Figure 22.

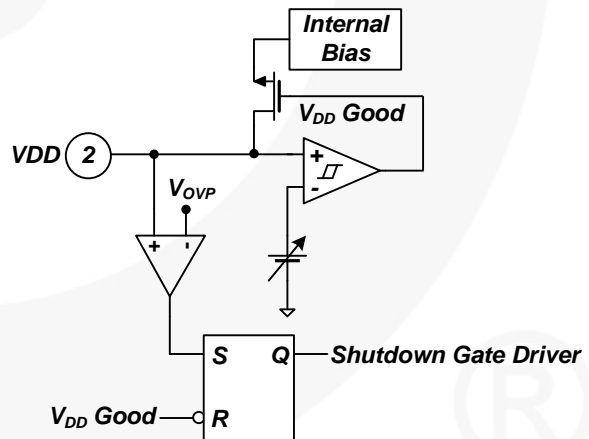

Figure 21. Internal OVP Block

Figure 22. Waveforms at Open-LED Condition

Over-Temperature Protection (OTP)

The built-in temperature-sensing circuit shuts down PWM output once the junction temperature exceeds 150°C. While PWM output is off, VDD gradually drops to the UVLO voltage. Some of the internal circuits are shut down and VDD gradually increases again. When VDD reaches 16V, all the internal circuits start operating. If the junction temperature is still higher than 140°C, the PWM controller shuts down immediately.

Under-Voltage Lockout (UVLO)

The turn-on and turn-off thresholds are fixed internally at 16V and 7.5V, respectively. During startup, the VDD capacitor must be charged to 16V through the startup resistor, so that the FLS32x7 is enabled. The VDD capacitor supplies VDD until power can be delivered from the auxiliary winding of the main transformer. VDD must not drop below 7.5V during startup. The UVLO hysteresis window ensures that the VDD capacitor is adequate to supply VDD during startup.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

PRODUCT STATUS DEFINITIONS

Definition of Terms

Datasheet Identification	Product Status	Definition
