# PCA9502

## 8-bit I/O expander with I²C-bus/SPI interface

Rev. 03 — 13 October 2006

**Product data sheet**

## 1. General description

The PCA9502 is an 8-bit I/O expander with I²C-bus/SPI host interface. The device comes in a very small HVQFN24 package, which makes it ideally suitable for hand-held, battery operated applications.

The device also supports software reset, which allows the host to reset the device at any time, independent of the hardware reset signal.

## 2. Features

### 2.1 General features

- Selectable I²C-bus or SPI interface
- 3.3 V or 2.5 V operation
- Industrial temperature range: −40 °C to +85 °C
- Eight programmable I/O pins
- Software reset
- Industrial and commercial temperature ranges
- Available in HVQFN24 package
- 16 hardware-selectable slave addresses

### 2.2 I²C-bus features

- Noise filter on SCL/SDA inputs
- 400 kbit/s (maximum)
- Compliant with I²C-bus Fast-mode
- Slave mode only

### 2.3 SPI features

- 15 Mbit/s maximum speed
- Slave mode only
- SPI Mode 0

## 3. Applications

- Factory automation and process control
- Portable and battery operated devices
- Cellular data devices

founded by Philips

## 4. Ordering information

**Table 1.** Ordering information

| Type number | Package | | | |
|---|---|---|---|---|
| | **Name** | **Description** | | **Version** |
| PCA9502BS | HVQFN24 | plastic thermal enhanced very thin quad flat package; no leads; 24 terminals; body 4 × 4 × 0.85 mm | | SOT616-3 |

## 5. Block diagram

**Fig 1.** Block diagram of PCA9502 I²C-bus interface

**Fig 2.** Block diagram of PCA9502 SPI interface

## 6. Pinning information

### 6.1 Pinning

a. I²C-bus interface    b. SPI interface

**Fig 3. Pin configuration for HVQFN24**

### 6.2 Pin description

**Table 2.    Pin description**

| Symbol | Pin | Type | Description |
|---|---|---|---|
| $\overline{\text{RESET}}$ | 1 | I | device hardware reset (active LOW)[1] |
| $V_{DD}$ | 2, 3, 11, 22, 24 | - | power supply |
| I2C/$\overline{\text{SPI}}$ | 4 | I | I²C-bus or SPI interface select. I²C-bus interface is selected if this pin is at logic HIGH. SPI interface is selected if this pin is at logic LOW. |
| $\overline{\text{CS}}$/A0 | 5 | I | SPI chip select or I²C-bus device address select A0. If SPI configuration is selected by I2C/$\overline{\text{SPI}}$ pin, this pin is the SPI chip select pin (Schmitt trigger, active LOW). If I²C-bus configuration is selected by I2C/$\overline{\text{SPI}}$ pin, this pin along with A1 pin allows user to change the device's base address. |
| SI/A1 | 6 | I | SPI data input pin or I²C-bus device address select A1. If SPI configuration is selected by I2C/$\overline{\text{SPI}}$ pin, this is the SPI data input pin. If I²C-bus configuration is selected by I2C/$\overline{\text{SPI}}$ pin, this pin along with A0 pin allows user to change the device's base address. To select the device address, please refer to Table 11. |
| SO | 7 | O | SPI data output pin. If SPI configuration is selected by I2C/$\overline{\text{SPI}}$ pin, this is a 3-stateable output pin. If I²C-bus configuration is selected by I2C/$\overline{\text{SPI}}$ pin, this pin function is undefined and must be left as n.c. (not connected). |
| SCL/SCLK | 8 | I | I²C-bus or SPI input clock. |
| SDA | 9 | I/O | I²C-bus data input/output, open-drain if I²C-bus configuration is selected by I2C/$\overline{\text{SPI}}$ pin. If SPI configuration is selected then this pin is an undefined pin and must be connected to $V_{SS}$. |

**Table 2.** **Pin description** *…continued*

| Symbol | Pin | Type | Description |
|--------|-----|------|-------------|
| $\overline{\text{IRQ}}$ | 12 | O | Interrupt (open-drain, active LOW). Interrupt is enabled when interrupt sources are enabled in the I/O Interrupt Enable register (IOIntEna). The interrupt condition is the change of state of the input pins. An external resistor (1 kΩ for 3.3 V, 1.5 kΩ for 2.5 V) must be connected between this pin and $V_{DD}$. |
| GPIO0 | 13 | I/O | programmable I/O pin |
| GPIO1 | 14 | I/O | programmable I/O pin |
| GPIO2 | 15 | I/O | programmable I/O pin |
| GPIO3 | 16 | I/O | programmable I/O pin |
| GPIO4 | 18 | I/O | programmable I/O pin |
| GPIO5 | 19 | I/O | programmable I/O pin |
| GPIO6 | 20 | I/O | programmable I/O pin |
| GPIO7 | 21 | I/O | programmable I/O pin |
| $V_{SS}$ | 10, 17, 23 | - | ground |
| $V_{SS}$ | center pad | - | The center pad on the back side of the HVQFN24 package is metallic and should be connected to ground on the printed-circuit board. |

[1] See Section 7.1 "Hardware reset, Power-On Reset (POR) and software reset"

# 7. Functional description

The device interfaces to a host through either I$^2$C-bus or SPI interface (selectable through I2C/$\overline{\text{SPI}}$ pin), and provides the host with eight programmable GPIO pins.

## 7.1 Hardware reset, Power-On Reset (POR) and software reset

These three reset methods are identical and will reset the internal registers as indicated in Table 3.

Table 3 summarizes the state of registers after reset.

**Table 3.** **Registers after reset**

| Register | Reset state |
|----------|-------------|
| I/O direction | all bits cleared |
| I/O interrupt enable | all bits cleared |
| I/O control | all bits cleared |

Table 4 summarizes the state of hardware pins after reset.

**Table 4.** **Signals after reset**

| Signal | Reset state |
|--------|-------------|
| I/Os | inputs |
| $\overline{\text{IRQ}}$ | HIGH by external pull-up |

PCA9502_3

**Product data sheet**

**Rev. 03 — 13 October 2006** **4 of 25**

### 7.2 Interrupts

The PCA9502 has interrupt generation capability. The interrupt enable register (IOIntEna) enables interrupts due to I/O pin change of state, and the $\overline{\text{IRQ}}$ signal in response to an interrupt generation.

## 8. Register descriptions

The programming combinations for register selection are shown in Table 5.

**Table 5.    Register map - read/write properties**

| Register name | Read mode | Write mode |
|---|---|---|
| IODir | I/O pin direction | I/O pin direction |
| IOState | I/O pin states | n/a |
| IOIntEna | I/O interrupt enable register | I/O interrupt enable register |
| IOControl | I/O pins control | I/O pins control |

**Table 6.    PCA9502 internal registers**

| Register address | Register | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | R/W |
|---|---|---|---|---|---|---|---|---|---|---|
| **General Register Set** | | | | | | | | | | |
| 0x0A[1] | IODir | bit 7 | bit 6 | bit 5 | bit 4 | bit 3 | bit 2 | bit 1 | bit 0 | R/W |
| 0x0B[1] | IOState | bit 7 | bit 6 | bit 5 | bit 4 | bit 3 | bit 2 | bit 1 | bit 0 | R/W |
| 0x0C[1] | IOIntEna | bit 7 | bit 6 | bit 5 | bit 4 | bit 3 | bit 2 | bit 1 | bit 0 | R/W |
| 0x0D[1] | reserved [2] | reserved [2] | reserved [2] | reserved [2] | reserved [2] | reserved [2] | reserved [2] | reserved [2] | reserved [2] | |
| 0x0E[1] | IOControl | reserved [2] | reserved [2] | reserved [2] | reserved [2] | SReset | reserved [2] | reserved [2] | IOLatch | R/W |

[1]    Other addresses 0x00 through 0x09, 0x0F are reserved and should not be accessed (read or write).

[2]    These bits are reserved and should be set to 0.

### 8.1 Programmable I/O pins Direction register (IODir)

This register is used to program the I/O pins direction. Bit 0 to bit 7 control GPIO0 to GPIO7.

**Table 7.    IODir register (address 0x0A) bit description**

| Bit | Symbol | Description |
|---|---|---|
| 7:0 | IODir | set GPIO pins 7:0 to input or output |
| | | 0 = input |
| | | 1 = output |

**Remark:** If there is a pending input (GPIO) interrupt and IODir is written, this pending interrupt will be cleared, that is, the interrupt signal will be negated.

PCA9502_3

**Product data sheet** **Rev. 03 — 13 October 2006** **5 of 25**

## 8.2 Programmable I/O pins State register (IOState)

When 'read', this register returns the actual state of all I/O pins. When 'write', each register bit will be transferred to the corresponding IO pin programmed as output.

**Table 8.    IOState register (address 0x0B) bit description**

| Bit | Symbol | Description |
|-----|--------|-------------|
| 7:0 | IOState | Write this register: set the logic level on the output pins |
| | | 0 = set output pin to zero |
| | | 1 = set output pin to one |
| | | Read this register: return states of all pins |

## 8.3 I/O Interrupt Enable register (IOIntEna)

This register enables the interrupt due to a change in the I/O configured as inputs.

**Table 9.    IOIntEna register (address 0x0C) bit description**

| Bit | Symbol | Description |
|-----|--------|-------------|
| 7:0 | IOIntEna | input interrupt enable |
| | | 0 = a change in the input pin will not generate an interrupt |
| | | 1 = a change in the input will generate an interrupt |

## 8.4 I/O Control register (IOControl)

**Table 10.    IOControl register (address 0x0E) bit description**

| Bit | Symbol | Description |
|-----|--------|-------------|
| 7:4 | - | reserved for future use |
| 3 | SReset | software reset |
| | | A write to this bit will reset the device. Once the device is reset this bit is automatically set to 0. |
| 2:1 | - | reserved for future use |
| 0 | IOLatch | enable/disable inputs latching |
| | | 0 = input values are not latched. A change in any input generates an interrupt. A read of the input register clears the interrupt. If the input goes back to its initial logic state before the input register is read, then the interrupt is cleared. |
| | | 1 = input values are latched. A change in the input generates an interrupt and the input logic value is loaded in the bit of the corresponding input state register (IOState). A read of the IOState register clears the interrupt. If the input pin goes back to its initial logic state before the interrupt register is read, then the interrupt is not cleared and the corresponding bit of the IOState register keeps the logic value that initiates the interrupt. |
| | | Example: If GPIO4 input was as logic 0 and the input goes to logic 1 then back to logic 0, the IOState register will capture this change and an interrupt is generated (if enabled). When the read is performed on the IOState register, the interrupt is de-asserted, assuming there were no additional input(s) that changed, and bit 4 of the IOState register will read '1'. The next read of the IOState register should now read '0'. |

## 9. I2C-bus operation

The two lines of the I2C-bus are a serial data line (SDA) and a serial clock line (SCL). Both lines are connected to a positive supply via a pull-up resistor, and remain HIGH when the bus is not busy. Each device is recognized by a unique address whether it is a microcomputer, LCD driver, memory or keyboard interface and can operate as either a transmitter or receiver, depending on the function of the device. A device generating a message or data is a transmitter, and a device receiving the message or data is a receiver. Obviously, a passive function like an LCD driver could only be a receiver, while a microcontroller or a memory can both transmit and receive data.

### 9.1 Data transfers

One data bit is transferred during each clock pulse (see Figure 4). The data on the SDA line must remain stable during the HIGH period of the clock pulse in order to be valid. Changes in the data line at this time will be interpreted as control signals. A HIGH-to-LOW transition of the data line (SDA) while the clock signal (SCL) is HIGH indicates a START condition, and a LOW-to-HIGH transition of the SDA while SCL is HIGH defines a STOP condition (see Figure 5). The bus is considered to be busy after the START condition and free again at a certain time interval after the STOP condition. The START and STOP conditions are always generated by the master.

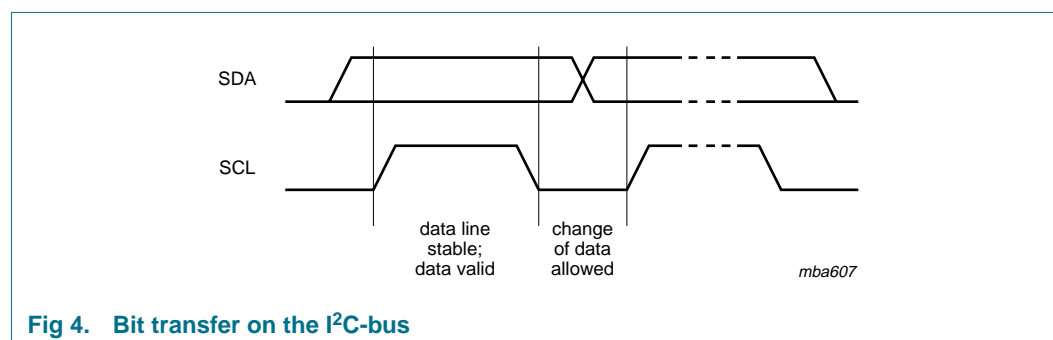

**Fig 4. Bit transfer on the I2C-bus**

**Fig 5. START and STOP conditions**

The number of data bytes transferred between the START and STOP condition from transmitter to receiver is not limited. Each byte, which must be eight bits long, is transferred serially with the most significant bit first, and is followed by an acknowledge bit. (see Figure 6). The clock pulse related to the acknowledge bit is generated by the master. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, while the transmitting device releases this pulse (see Figure 7).

**Fig 6. Data transfer on the I²C-bus**

**Fig 7. Acknowledge on the I²C-bus**

A slave receiver must generate an acknowledge after the reception of each byte, and a master must generate one after the reception of each byte clocked out of the slave transmitter.

There is an exception to the 'acknowledge after every byte' rule. It occurs when a master is a receiver: it must signal an end of data to the transmitter by **not** signalling an acknowledge on the last byte that has been clocked out of the slave. The acknowledge related clock, generated by the master should still take place, but the SDA line will not be pulled down. In order to indicate that this is an active and intentional lack of acknowledgement, we shall term this special condition as a 'negative acknowledge'.

## 9.2 Addressing and transfer formats

Each device on the bus has its own unique address. Before any data is transmitted on the bus, the master transmits on the bus the address of the slave to be accessed for this transaction. A well-behaved slave with a matching address, if it exists on the network, should of course acknowledge the master's addressing. The addressing is done by the first byte transmitted by the master after the START condition.

An address on the network is seven bits long, appearing as the most significant bits of the address byte. The last bit is a direction (R/$\overline{W}$) bit. A '0' indicates that the master is transmitting (write) and a '1' indicates that the master requests data (read). A complete data transfer, comprised of an address byte indicating a 'write' and two data bytes is shown in Figure 8.

PCA9502_3

**Product data sheet** **Rev. 03 — 13 October 2006** **8 of 25**

*002aab046*
**Fig 8. A complete data transfer**

When an address is sent, each device in the system compares the first seven bits after the START with its own address. If there is a match, the device will consider itself addressed by the master, and will send an acknowledge. The device could also determine if in this transaction it is assigned the role of a slave receiver or slave transmitter, depending on the R/$\overline{W}$ bit.

Each node of the I²C-bus network has a unique seven-bit address. The address of a microcontroller is of course fully programmable, while peripheral devices usually have fixed and programmable address portions.

When the master is communicating with one device only, data transfers follow the format of Figure 8, where the R/$\overline{W}$ bit could indicate either direction. After completing the transfer and issuing a STOP condition, if a master would like to address some other device on the network, it could start another transaction by issuing a new START.

Another way for a master to communicate with several different devices would be by using a 'repeated START'. After the last byte of the transaction was transferred, including its acknowledge (or negative acknowledge), the master issues another START, followed by address byte and data, without effecting a STOP. The master may communicate with a number of different devices, combining 'reads' and 'writes'. After the last transfer takes place, the master issues a STOP and releases the bus. Possible data formats are demonstrated in Figure 9. Note that the repeated START allows for both change of a slave and a change of direction, without releasing the bus. We shall see later on that the change of direction feature can come in handy even when dealing with a single device.

In a single master system, the repeated START mechanism may be more efficient than terminating each transfer with a STOP and starting again. In a multimaster environment, the determination of which format is more efficient could be more complicated, as when a master is using repeated STARTs it occupies the bus for a long time and thus preventing other devices from initiating transfers.
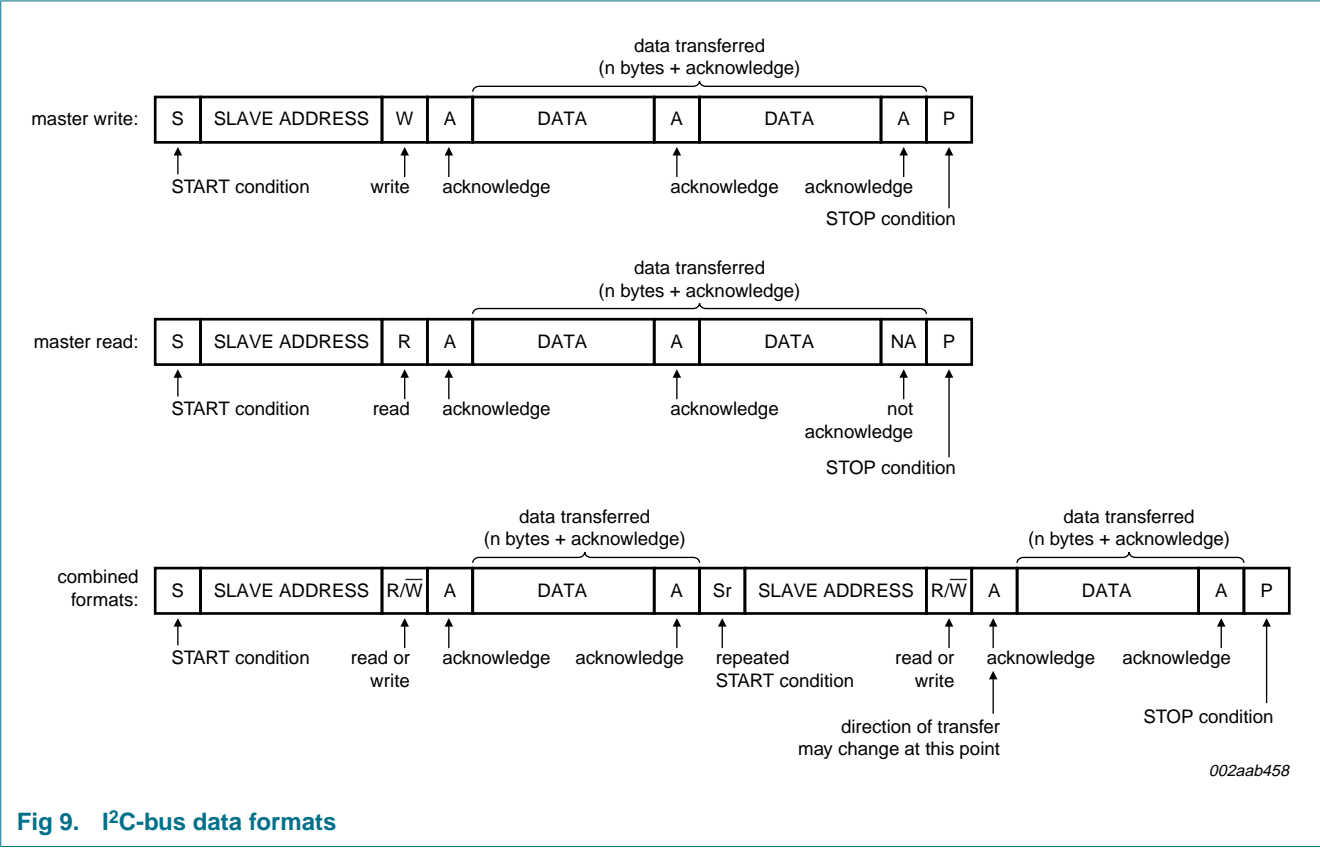

**Fig 9.** I²C-bus data formats

## 9.3 Addressing

Before any data is transmitted or received, the master must send the address of the receiver via the SDA line. The first byte after the START condition carries the address of the slave device and the read/write bit. Table 11 shows how the PCA9502's address can be selected by using A1 and A0 pins. For example, if these 2 pins are connected to $V_{DD}$, then the PCA9502's address is set to 0x90, and the master communicates with it through this address.
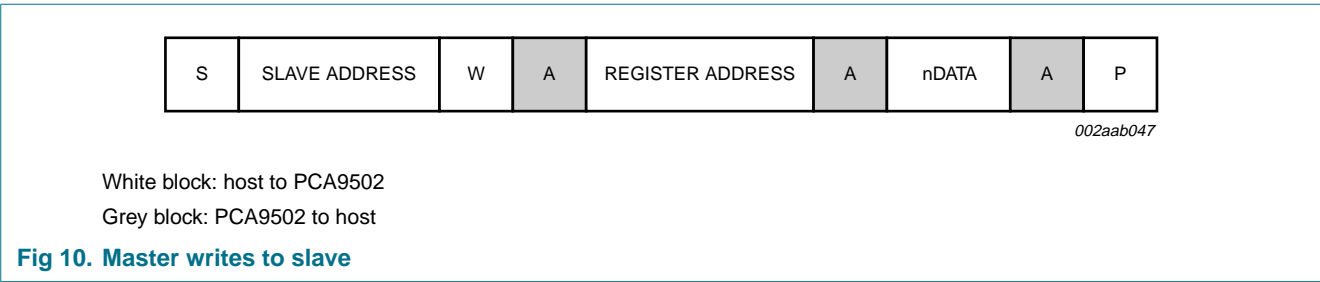

**Table 11.    PCA9502 address map**

| A1 | A0 | PCA9502 I²C-bus addresses (hex)[1] |
|---|---|---|
| $V_{DD}$ | $V_{DD}$ | 0x90 (1001 000X) |
| $V_{DD}$ | $V_{SS}$ | 0x92 (1001 001X) |
| $V_{DD}$ | SCL | 0x94 (1001 010X) |
| $V_{DD}$ | SDA | 0x96 (1001 011X) |
| $V_{SS}$ | $V_{DD}$ | 0x98 (1001 100X) |
| $V_{SS}$ | $V_{SS}$ | 0x9A (1001 101X) |
| $V_{SS}$ | SCL | 0x9C (1001 110X) |
| $V_{SS}$ | SDA | 0x9E (1001 111X) |
| SCL | $V_{DD}$ | 0xA0 (1010 000X) |
| SCL | $V_{SS}$ | 0xA2 (1010 001X) |
| SCL | SCL | 0xA4 (1010 010X) |
| SCL | SDA | 0xA6 (1010 011X) |
| SDA | $V_{DD}$ | 0xA8 (1010 100X) |
| SDA | $V_{SS}$ | 0xAA (1010 101X) |
| SDA | SCL | 0xAC (1010 110X) |
| SDA | SDA | 0xAE (1010 111X) |

[1]    X = logic 0 for write cycle; X = logic 1 for read cycle.

## 9.4 Use of sub-addresses

When a master communicates with the PCA9502 it must send a sub-address in the byte following the slave address byte. This sub-address is the internal address of the word the master wants to access for a single byte transfer, or the beginning of a sequence of locations for a multi-byte transfer. A sub-address is an 8-bit byte. Unlike the device address, it does not contain a direction (R/$\overline{W}$) bit, and like any byte transferred on the bus it must be followed by an acknowledge.

A register write cycle is shown in Figure 10. The START is followed by a slave address byte with the direction bit set to 'write', a sub-address byte, a number of data bytes, and a STOP signal. The sub-address indicates which register the master wants to access. and the data bytes which follow will be written one after the other to the sub-address location.

|---|---|---|---|---|---|---|---|---|

*002aab047*

White block: host to PCA9502

Grey block: PCA9502 to host

**Fig 10. Master writes to slave**

The register read cycle (see Figure 11) commences in a similar manner, with the master sending a slave address with the direction bit set to 'write' with a following sub-address. Then, in order to reverse the direction of the transfer, the master issues a repeated START followed again by the device address, but this time with the direction bit set to 'read'. The data bytes starting at the internal sub-address will be clocked out of the device, each followed by a master-generated acknowledge. The last byte of the read cycle will be followed by a negative acknowledge, signalling the end of transfer. The cycle is terminated by a STOP signal.

| $I_L$ | leakage current | input; $V_I$ = 0 V or 5.5 V[1] | - | 10 | - | 10 | µA |
| $C_i$ | input capacitance | | - | 7 | - | 7 | pF |

[1]    5.5 V steady state voltage tolerance on inputs and outputs is valid only when the supply voltage is present. 3.8 V steady state voltage tolerance on inputs and outputs when no supply voltage is present.

# 13. Dynamic characteristics

**Table 16.    I2C-bus timing specifications**

*All the timing limits are valid within the operating supply voltage, ambient temperature range and output load;*
$V_{DD}$ = (2.5 V ± 0.2 V) or (3.3 V ± 0.3 V); $T_{amb}$ = −40 °C to +85 °C; refer to $V_{IL}$ and $V_{IH}$ with an input voltage of $V_{SS}$ to $V_{DD}$.
*All output load = 25 pF, except SDA output load = 400 pF.[1]*

| Symbol | Parameter | Conditions | Standard-mode I2C-bus | | Fast-mode I2C-bus | | Unit |
|---|---|---|---|---|---|---|---|
| | | | Min | Max | Min | Max | |
| $f_{SCL}$ | SCL clock frequency | [2] | 0 | 100 | 0 | 400 | kHz |
| $t_{BUF}$ | bus free time between a STOP and START condition | | 4.7 | - | 1.3 | - | µs |
| $t_{HD;STA}$ | hold time (repeated) START condition | | 4.0 | - | 0.6 | - | µs |
| $t_{SU;STA}$ | set-up time for a repeated START condition | | 4.7 | - | 0.6 | - | µs |
| $t_{SU;STO}$ | set-up time for STOP condition | | 4.7 | - | 0.6 | - | µs |
| $t_{HD;DAT}$ | data hold time | | 0 | - | 0 | - | ns |
| $t_{VD;ACK}$ | data valid acknowledge time | | - | 0.6 | - | 0.6 | µs |
| $t_{VD;DAT}$ | data valid time | SCL LOW to data out valid | - | 0.6 | - | 0.6 | ns |
| $t_{SU;DAT}$ | data set-up time | | 250 | - | 150 | - | ns |
| $t_{LOW}$ | LOW period of the SCL clock | | 4.7 | - | 1.3 | - | µs |
| $t_{HIGH}$ | HIGH period of the SCL clock | | 4.0 | - | 0.6 | - | µs |
| $t_f$ | fall time of both SDA and SCL signals | | - | 300 | - | 300 | ns |
| $t_r$ | rise time of both SDA and SCL signals | | - | 1000 | - | 300 | ns |
| $t_{SP}$ | pulse width of spikes that must be suppressed by the input filter | | - | 50 | - | 50 | ns |
| $t_{d1}$ | I2C-bus GPIO output valid time | | 0.5 | - | 0.5 | - | µs |
| $t_{d4}$ | I2C input pin interrupt valid time | | 0.2 | - | 0.2 | - | µs |
| $t_{d5}$ | I2C input pin interrupt clear time | | 0.2 | - | 0.2 | - | µs |

[1]    A detailed description of the I2C-bus specification, with applications, is given in brochure *"The I2C-bus and how to use it"*. This brochure may be ordered using the code 9398 393 40011.

[2]    Minimum SCL clock frequency is limited by the bus time-out feature, which resets the serial bus interface if SDA is held LOW for a minimum of 25 ms.

Rise and fall times refer to $V_{IL}$ and $V_{IH}$.

## 15. Handling information

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be completely safe you must take normal precautions appropriate to handling integrated circuits.

## 16. Soldering

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### 16.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 16.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus PbSn soldering

### 16.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

## 16.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see Figure 20) than a PbSn process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 18 and 19

**Table 18.  SnPb eutectic process (from J-STD-020C)**

| Package thickness (mm) | Package reflow temperature (°C) | |
| --- | --- | --- |
| | Volume (mm³) | |
| | < 350 | ≥ 350 |
| < 2.5 | 235 | 220 |
| ≥ 2.5 | 220 | 220 |

**Table 19.  Lead-free process (from J-STD-020C)**

| Package thickness (mm) | Package reflow temperature (°C) | | |
| --- | --- | --- | --- |
| | Volume (mm³) | | |
| | < 350 | 350 to 2000 | > 2000 |
| < 1.6 | 260 | 260 | 260 |
| 1.6 to 2.5 | 260 | 250 | 245 |
| > 2.5 | 250 | 245 | 245 |

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 20.

MSL: Moisture Sensitivity Level

**Fig 20. Temperature profiles for large and small components**
For further information on temperature profiles, refer to Application Note *AN10365 "Surface mount reflow soldering description"*.

# 17. Abbreviations

**Table 20.    Abbreviations**

| Acronym | Description |
| --- | --- |
| GPIO | General Purpose Input/Output |
| I²C-bus | Inter Integrated Circuit bus |
| I/O | Input/Output |
| LCD | Liquid Crystal Display |
| POR | Power-On Reset |
| SPI | Serial Peripheral Interface |

## 18. Revision history

**Table 21. Revision history**

| Document ID | Release date | Data sheet status | Change notice | Supersedes |
|---|---|---|---|---|
| PCA9502_3 | 20061013 | Product data sheet | - | PCA9502_2 |
| Modifications: | • The format of this data sheet has been redesigned to comply with the new identity guidelines of NXP Semiconductors. <br> • Legal texts have been adapted to the new company name where appropriate. <br> • Table 15 "Static characteristics", sub-section "Supplies": <br>   – $I_{DD}$, supply current, operating; no load: changed maximum limit from 6.0 mA to 750 µA for both 2.5 V and 3.3 V supply voltage ranges <br>   – $I_{DD}$, supply current: added "static; no load" Conditions (max 600 µA) | | | |

## 19. Legal information

### 19.1 Data sheet status

| Document status[1][2] | Product status[3] | Definition |
|---|---|---|
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

### 19.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

### 19.3 Disclaimers

**General** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of a NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Terms and conditions of sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

### 19.4 Trademarks
