

MAX2839 Evaluation Kit

General Description

The MAX2839 evaluation kit (EV kit) simplifies testing of the MAX2839 receive and transmit performance in WiMAX™ applications operating in the 2.3GHz to 2.7GHz band. The EV kit provides 50Ω SMA connectors for all RF and baseband inputs and outputs. Differential to single-ended and single-ended to differential line drivers are provided to convert the differential I/Q baseband inputs and outputs to single ended.

Features

- ◆ On-Board Line Drivers and Voltage References
- ◆ 50Ω SMA Connectors on All RF and Baseband Ports

Ordering Information

Quick Start

Recommended Test Equipment

This section lists the recommended test equipment to verify the operation of the MAX2839. It is intended as a guide only and substitutions may be possible.

- DC supply capable of delivering +5V and 250mA of continuous current
- DC supply capable of delivering -5V and 250mA of continuous current
- DC supply capable of delivering +3.3V and 250mA of continuous current
- One HP 8648 or equivalent signal source capable of generating 0dBm up to 2.7GHz
- Two HP or equivalent arbitrary waveform generators
- One HP 8561E or equivalent RF spectrum analyzer with a minimum 100kHz to 3GHz frequency range
- One HP 437B power meter and power head
- A user-supplied Windows® 95/98/2000/XP (or later) PC with an available parallel port
- One female-to-male 25-pin parallel straight-through cable

Connections and Setup

The MAX2839 EV kit is fully assembled and factory tested. Follow the instructions below to test the devices. This section provides step-by-step instructions for getting the EV kit up and running in all modes:

- 1) Install and run the MAX2839 control software. Select MAX2839 Ev.Kt for "select IC" under Options.
- 2) To control the EV kit through the 4-wire interface, connect the female-to-male 25-pin parallel straight-through cable between the PC and the EV kit.

- 3) With the power supply turned off, connect the +3.3V power supply to VBAT and VCCAUX. Connect the power-supply ground to the header labeled GND.
- 4) With the power supply turned off, connect the +5V power supply to the +5V pin and the -5V power supply to the -5V pin. Connect the power-supply ground to the header labeled GND. Connect all the power-supply grounds together.
- 5) Set the RXBBBUF jumper across pins 1-2 to enable the Rx baseband buffers.
- 6) Turn on the +3.3V power supply, and the +5V and -5V power supplies.
- 7) In the enables panel of the software, check the EN_SPI box to enable the 3-wire interface.
- 8) Adjust the Tx common-mode potentiometer (R36) until measuring 0.9V common-mode voltage at the VCM test point.
- 9) In the register panel of the software, set ENABLE to 0 and RXTX to 1 to put the IC into standby mode.
- 10) In the synth panel of the software, set the LO frequency to 2500MHz.

Receive Mode

- 1) Use the power meter to calibrate the RF signal generator to deliver -98dBm at 2501MHz. After calibration, turn the RF signal generator off, disconnect it from the power meter, and connect it to the RXINA port of the MAX2839 EV kit.
- 2) Connect either the I or the Q baseband output of receiver A to a spectrum analyzer. Set the center frequency to 1MHz and the span to 1MHz.
- 3) In the register panel of the software, enter the recommended register setting shown in Figure 1 for

Windows is a registered trademark of Microsoft Corp.

MAX2839 Evaluation Kit

operating the MAX2839 in steady state receive mode bench measurement. This setup fixes the VGA highpass corner at 1kHz.

- 4) Press the SEND ALL button.
- 5) In the register panel of the software, set ENABLE and RXTX to be 1 to activate the receive path.
- 6) In the Rx panel of the software, toggle the LNA gain enable and the baseband VGA enable both to be SPI. Set both of the gain controls to be max.
- 7) Turn on the RF signal source. The output CW tone at 1MHz should be approximately 0dBm.

Transmit Mode

- 1) Connect the spectrum analyzer to the TXRF port. Set the center frequency to 2500MHz and the span to 5MHz.
- 2) Connect a 1MHz I/Q signal to pins TXBBI and TXBBQ, respectively. Set the input amplitude of each channel to 90mVRMS with 90° phase shift.
- 3) In the register panel of the software, set ENABLE to 1 and RXTX to 0 to activate the transmit path.
- 4) In the register panel of the software, enter the recommended register setting shown in Figure 2.
- 5) Press the SEND ALL button.

The screenshot shows the MAX2839 software interface with the Register panel selected. The interface includes a menu bar (Exit, Options, Help, Settings), a tabbed view (Registers, Enables, Synth, RX, TX, Misc, Defaults, Send All), and a LOCK button. The Register panel displays 32 registers, each with a name, a 16-bit binary value, a decimal value, and a Send button. The registers are arranged in two columns. On the right side, there is a Control Pins section with checkboxes for ENABLE, RXTX, LOAD, and RXHP, and a Pulse "LOAD" button. At the bottom right, there are buttons for Help, Send All, and Read All.

Register Name	Binary Value	Decimal Value	Send

MAX2839 Evaluation Kit

- 6) Enable the output of the baseband signal sources. The desired tone, LO leakage, and the sideband appear at 2501MHz, 2500MHz, and 2499MHz, respectively. Set the Tx VGA gain to be 3dB below the max gain. The power level of the desired tone is approximately -1dBm in the spectrum analyzer marker reading, assuming that the balun on board contributes 1dB of loss.

Layout Considerations

The MAX2839 EV kit can serve as a guide for board layout. Keep PCB trace lengths as short as possible to minimize parasitic inductance. Also, keep decoupling

capacitors as close to the IC as possible with a direct connection to the ground plane.

Power-Supply Layout

To minimize coupling between different sections of the IC, use a "star" power-supply routing configuration with a large decoupling capacitor at a central VCC node. The VCC traces branch out from this node, each going to a separate VCC node in the circuit. Place a bypass capacitor as close to each supply pin as possible. This arrangement provides local decoupling at each VCC pin. Use at least one via per bypass capacitor for a low-inductance ground connection. Do not share the capacitor ground vias with any other branch.
