

8-/9-/10-Bit Bus Interface Registers

Features

- Function, pinout, and drive compatible with FCT, F, and Am29821/23/25 logic
- FCT-C speed at 6.0 ns max.
FCT-B speed at 7.5 ns max.
- Reduced V_{OH} (typically = 3.3V) versions of equivalent FCT functions
- Edge-rate control circuitry for significantly improved noise characteristics
- Power-off disable feature
- Matched rise and fall times
- Fully compatible with TTL input and output logic levels
- ESD > 2000V
- Sink current 64 mA
Source current 32 mA
- High-speed parallel registers with positive edge-triggered D-type flip-flops
- Buffered common clock enable (EN) and asynchronous clear input (CLR)
- Extended commercial range of -40°C to $+85^{\circ}\text{C}$

Functional Description

These bus interface registers are designed to eliminate the extra packages required to buffer existing registers and provide extra data width for wider address/data paths or buses carrying parity. The FCT821T is a buffered, 10-bit wide version of the popular FCT374 function. The FCT823T is a 9-bit wide buffered register with clock enable (EN) and clear (CLR) ideal for parity bus interfacing in high-performance microprogrammed systems. The FCT825T is an 8-bit buffered register with all the FCT823T controls plus multiple enables ($\overline{OE}_1$, $\overline{OE}_2$, $\overline{OE}_3$) to allow multiuser control of the interface, e.g., CS, DMA, and RD/WR. They are ideal for use as an output port requiring high I_{OL}/I_{OH} .

These devices are designed for high-capacitance load drive capability, while providing low-capacitance bus loading at both inputs and outputs. Outputs are designed for low-capacitance bus loading in the high-impedance state and are designed with a power-off disable feature to allow for live insertion of boards.

Pin Description

Name	I/O	Description
D	I	The D flip-flop data inputs.
CLR	I	When CLR is LOW and OE is LOW, the Q outputs are LOW. When CLR is HIGH, data can be entered into the register.
CP	O	Clock Pulse for the register; enters data into the register on the LOW-to-HIGH transition.
Y	O	The register three-state outputs.
EN	I	Clock Enable. When EN is LOW, data on the D input is transferred to the Q output on the LOW-to-HIGH clock transition. When EN is HIGH, the Q outputs do not change state, regardless of the data or clock input transitions.
OE	I	Output Control. When OE is HIGH, the Y outputs are in the high-impedance state. When OE is LOW, the TRUE register data is present at the Y outputs.

Notes:

- H = HIGH Voltage Level, L = LOW Voltage Level, X = Don't Care, NC = No Change, ┐ = LOW-to-HIGH Transition, Z = HIGH Impedance.
- Unless otherwise noted, these limits are over the operating free-air temperature range.
- Unused inputs must always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground.

Capacitance^[6]

Parameter	Description	Typ. ^[5]	Max.	Unit
C _{IN}	Input Capacitance	5	10	pF
C _{OUT}	Output Capacitance	9	12	pF

Notes:

- Typical values are at V_{CC}=5.0V, T_A=+25°C ambient.
- This parameter is specified but not tested.
- Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

Power Supply Characteristics

Parameter	Description	Test Conditions	Typ. ^[5]	Max.	Unit

Notes:

8. Per TTL driven input ($V_{IN}=3.4V$); all other inputs at V_{CC} or GND.
9. This parameter is not directly testable, but is derived for use in Total Power Supply calculations.
10. $I_C = I_{\text{QUIESCENT}} + I_{\text{INPUTS}} + I_{\text{DYNAMIC}}$
 $I_C = I_{CC} + \Delta I_{CC} D_H N_T + I_{CCD} (f_0/2 + f_1 N_1)$
 I_{CC} = Quiescent Current with CMOS input levels
 ΔI_{CC} = Power Supply Current for a TTL HIGH input ($V_{IN}=3.4V$)
 D_H = Duty Cycle for TTL inputs HIGH
 N_T = Number of TTL inputs at D_H
 I_{CCD} = Dynamic Current caused by an input transition pair (HLH or LHL)
 f_0 = Clock frequency for registered devices, otherwise zero
 f_1 = Input signal frequency
 N_1 = Number of inputs changing at f_1
 All currents are in milliamps and all frequencies are in megahertz.
11. Values for these conditions are examples of the I_{CC} formula. These limits are specified but not tested.
