

DRV8804 Quad Serial Interface Low-Side Driver IC

1 Features

- 4-Channel Protected Low-Side Driver
 - Four N-Channel MOSFETs With Overcurrent Protection
 - Integrated Inductive Clamp Diodes
 - Serial Interface
- DW Package: 1.5A (Single Channel On) / 800mA (Four Channels On) Maximum Drive Current per Channel (at 25°C)
- PWP Package: 2A (Single Channel On) / 1A (Four Channels On) Maximum Drive Current per Channel (at 25°C, With Proper PCB Heatsinking)
- DYZ Package: 1.9A (Single Channel On) / 0.9A (Four Channels On) Maximum Drive Current per Channel (at 25°C, With Proper PCB Heatsinking)
- 8.2V to 60V Operating Supply Voltage Range
- Thermally-Enhanced Surface Mount Package

2 Applications

- Relay Drivers
- Unipolar Stepper Motor Drivers
- Solenoid Drivers
- General Low-Side Switch Applications

3 Description

The DRV8804 provides a 4-channel low-side driver with overcurrent protection. The device has built-in diodes to clamp turnoff transients generated by inductive loads and can be used to drive unipolar stepper motors, DC motors, relays, solenoids, or other loads.

In the SOIC (DW) package, the DRV8804 can supply up to 1.5A (one channel on) or 800mA (all channels on) continuous output current per channel, at 25°C. In the HTSSOP (PWP) package, the device can supply up to 2A (one channel on) or 1A (four channels on) continuous output current per channel, at 25°C. In the SOT-23-THN (DYZ) package, the DRV8804 can supply up to 1.9A (one channel on) or 900mA (all channels on) continuous output current per channel, at 25°C with proper PCB heatsinking.

A serial interface is provided including a serial data output, which can be daisy-chained to control multiple devices with one serial interface.

Internal shutdown functions are provided for overcurrent protection, short-circuit protection, undervoltage lockout, and overtemperature, and faults are indicated by a fault output pin.

The DRV8804 is available in a 20-pin, thermally-enhanced SOIC package, 16-pin HTSSOP package and 16-pin SOT-23-THN package (Eco-friendly: RoHS & no Sb/Br).

Device Information ⁽¹⁾

PART NUMBER	PACKAGE	PACKAGE SIZE ⁽²⁾	BODY SIZE (NOM)
DRV8804DW	SOIC (20)	12.80mm × 10.30mm	12.80mm × 7.50mm
DRV8804PWP	HTSSOP (16)	5.00mm × 6.40mm	5.00mm × 4.40mm
DRV8804DYZ	SOT-23-THN (16)	4.20mm × 2.00	4.20mm × 2.00mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
V _M	Power supply voltage	−0.3	65	V
V _{OUTx}	Output voltage	−0.3	65	V
V _{CLAMP}	Clamp voltage	−0.3	65	V
SDATOUT, nFAULT	Output current		20	mA
	Peak clamp diode current		2	A
	DC or RMS clamp diode current		1	A
	Digital input pin voltage	−0.5	7	V
SDATOUT, nFAULT	Digital output pin voltage	−0.5	7	V
	Peak motor drive output current, $t < 1 \mu s$	Internally limited		A
	Continuous total power dissipation	See Section 6.5		
T _J	Operating virtual junction temperature	−40	150	°C
T _{stg}	Storage temperature	−60	150	°C

(1) All voltage values are with respect to network ground terminal.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge		
	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±3000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _M	Power supply voltage	8.2		60	V
V _{CLAMP}	Output clamp voltage ⁽²⁾	0		60	V
I _{OUT}	Continuous output current, single channel on, T _A = 25°C, SOIC package ⁽¹⁾			1.5	A
	Continuous output current, four channels on, T _A = 25°C, SOIC package ⁽¹⁾			0.8	
	Continuous output current, single channel on, T _A = 25°C, HTSSOP package ⁽¹⁾			2	
	Continuous output current, four channels on, T _A = 25°C, HTSSOP package ⁽¹⁾			1	
	Continuous output current, single channel on, T _A = 25°C, DYZ package ⁽¹⁾			1.9	
	Continuous output current, four channels on, T _A = 25°C, DYZ package ⁽¹⁾			0.9	

(1) Power dissipation and thermal limits must be observed.

(2) V_{CLAMP} is used only to supply the clamp diodes. It is not a power supply input.

6.4 Electrical Characteristics

T_A = 25°C, over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES					
I _{VM}	VM operating supply current	V _M = 24 V		1.6	2.1 mA
V _{UVLO}	VM undervoltage lockout voltage	V _M rising		8.2	V

$T_A = 25^\circ\text{C}$, over recommended operating conditions (unless otherwise noted)

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.6 Timing Requirements

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	NOM	MAX	UNIT
1	t_{CYC}	Clock cycle time	62			ns
2	t_{CLKH}	Clock high time	25			ns
3	t_{CLKL}	Clock low time	25			ns
4	$t_{SU(SDATIN)}$	Setup time, SDATIN to SCLK	5			ns
5	$t_{H(SDATIN)}$	Hold time, SDATIN to SCLK	1			ns
6	$t_{D(SDATOUT)}$	Delay time, SCLK to SDATOUT, no external pullup resistor, $C_{OUT} = 100$ pF		50	100	ns
7	$t_{W(LATCH)}$	Pulse width, LATCH	200			ns
8	$t_{OE(ENABLE)}$	Enable time, nENBL to output low		60		ns
9	$t_{D(LATCH)}$	Delay time, LATCH to output change		200		ns
—	t_{RESET}	RESET pulse width	20			μs
10	$t_{D(RESET)}$	Reset delay before clock	20			μs
11	$t_{STARTUP}$	Start-up delay VM applied before clock	55			μs

(1) Not production tested.

More than 400 ns of delay should exist between the final SCLK rising edge and the LATCH rising edge. This ensures that the last data bit is shifted into the device properly.

Figure 6-5. $R_{DS(on)}$ Over Temperature

7 Detailed Description

7.1 Overview

The DRV8804 is an integrated 4-channel low side driver solution for a low side switch application. A serial interface controls the low-side driver outputs and allows for multiple drivers to be chained together and save space on communication lines. The four low-side driver outputs consist of four N-channel MOSFETs that have a typical $R_{DS(on)}$ of 500 mΩ (PWP and DW package) and 400 mΩ (DYZ Package). A single motor supply input V_M serves as device power and is internally regulated to power the low side gate drive. The device outputs can be disabled by bringing nENBL pin logic high. This device has several safety features including integrated overcurrent protection that limits the motor current to a fixed maximum above which the device will shut down. Thermal shutdown protection enables the device to automatically shut down if the die temperature exceeds a TTSD limit and will restart once the die reaches a safe temperature. UVLO protection will disable all circuitry in the device if V_M drops below the undervoltage lockout threshold.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Output Drivers

The DRV8804 contains four protected low-side drivers. Each output has an integrated clamp diode connected to a common pin, VCLAMP.

VCLAMP can be connected to the main power supply voltage, V_M . It can also be connected to a Zener or TVS diode to V_M , allowing the switch voltage to exceed the main supply voltage V_M . This connection can be beneficial when driving loads that require very fast current decay, such as unipolar stepper motors.

In all cases, the voltage on the outputs must not be allowed to exceed the maximum output voltage specification.

7.3.2 Serial Interface Operation

The DRV8804 is controlled with a simple serial interface. Logically, the interface is shown in [Figure 7-1](#).

Figure 7-1. Serial Interface Operation

Data is shifted into a temporary holding shift register in the part using the SDATIN pin, one bit at each rising edge of the SCLK pin. Data is simultaneously shifted out of the SDATOUT pin, allowing multiple devices to be daisy-chained onto one serial port. Note that the SDATOUT pin has a push-pull driver, which can support driving another DRV8804 SDATIN pin at clock frequencies of up to 1 MHz without an external pullup. A pullup resistor can be used between SDATOUT and an external 5-V logic supply to support higher clock frequencies. TI recommends a resistor value greater than 1 k Ω . The SDATOUT pin is capable of approximately 1-mA source and 5-mA sink. To supply logic signals to a lower-voltage microcontroller, use a resistor divider from SDATOUT to GND.

A rising edge on the LATCH pin latches the data from the temporary shift register into the output stage.

Daisy Chain Operation

The following Figure shows how two DRV81646 devices can be connected in daisy chain to leverage GPIO/ isolation saving. SDO pin of one device is fed to the SDI pin of the following device in the chain

Figure 7-2. Two DRV8804 devices in Daisy chain

To write to two devices , 8 bits of data need to be written as shown in Figure . Note SDO is sent out on Negedge of SCLK. SDO is ready to be sampled on following posedge of SCLK. The value on SDI pin is also sampled on posedge of SCLK. Note Latch need not be brought low to initiate a shift in of data. A posedge of Latch is needed to Latch the data shifted in to Outputs.

Figure 7-3. 8-bit packet for communication with two daisy chained devices

7.3.3 nENBL and RESET Operation

The nENBL pin enables or disables the output drivers. nENBL must be low to enable the outputs. nENBL does not affect the operation of the serial interface logic. Note that nENBL has an internal pulldown.

The RESET pin, when driven active high, resets internal logic, including the OCP fault. All serial interface registers are cleared. Note that RESET has an internal pulldown. An internal power-up reset is also provided, so driving RESET at power up is not required.

7.3.4 Protection Circuits

The DRV8804 is fully protected against undervoltage, overcurrent, and overtemperature events.

7.3.4.1 Overcurrent Protection (OCP)

An analog current limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current limit persists for longer than the t_{OCP} deglitch time (approximately 3.5 μ s), the driver will be disabled and the nFAULT pin will be driven low. The driver will remain disabled for the t_{RETRY} retry time (approximately 1.2 ms), then the fault will be automatically cleared. The fault will be cleared immediately if either RESET pin is activated or VM is removed and re-applied.

7.3.4.2 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all output FETs will be disabled and the nFAULT pin will be driven low. Once the die temperature has fallen to a safe level, operation will automatically resume.

7.3.4.3 Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage lockout (UVLO) threshold voltage, all circuitry in the device will be disabled, and internal logic will be reset. Operation will resume when V_M rises above the UVLO threshold.

7.4 Device Functional Modes

When the nENBL pin of the DRV8804 is pulled logic low, the open-drain FET outputs are enabled. Having the device be enabled at logic low allows for the use of long data lines in a high noise environment that do not unintentionally enable the device with coupled noise. The device will still shift data through the SDATIN / SDATOUT lines and SCLK line regardless of the state of the nENBL pin.

Once data has been moved into each of the four shift register lines the LATCH pin can be pulled high to output the state of the four shift registers. Once LATCH is pulled high the state of the four shift registers is placed in a logical AND with the inverse state of the nENBL pin. If the nENBL pin is logic low input and the LATCH pin is logic high the open-drain output of that driver channel will be turned on.

If the device detects that V_M has dropped below the UVLO threshold, it will immediately enter a state where all the internal logic is disabled. The device stays in a disabled state until V_M rises above the UVLO threshold and all internal logic is then reset. During an Overcurrent Protection (OCP) event the device removes gate drive for one t_{RETRY} interval and the nFAULT pin is driven low. The fault is cleared immediately if RESET is activated or V_M is removed and re-applied.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8804 device can be used to drive upto four unipolar loads such as unipolar BDCs, solenoids such as valves, relays etc.

8.2 Typical Application

Figure 8-1. Typical Application Schematic

8.2.1 Design Requirements

Table 8-1 lists the design parameters for this design example.

Table 8-1. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Supply Voltage	V_M	24 V
Motor Winding Resistance	R_L	7.4 Ω /phase
Motor Full Step Angle	θ_{step}	1.8°/step
Motor Rated Current	I_{RATED}	0.75 A

8.2.2 Detailed Design Procedure

8.2.2.1 Motor Voltage

The motor voltage to use will depend on the ratings of the motor selected and the desired torque. A higher voltage shortens the current rise time in the coils of the stepper motor allowing the motor to produce a greater average torque. Using a higher voltage also allows the motor to operate at a faster speed than a lower voltage.

8.2.2.2 Drive Current

The current path starts from the supply V_M , moves through the inductive winding load and low-side sinking NMOS power FET. Power dissipation losses in one sink NMOS power FET are shown in Equation 1.

$$P = I^2 \times R_{DS(on)} \quad (1)$$

The DRV8804 device has been measured to be capable of 1.5-A Single Channel or 800-mA Four Channels with the DW package, 2-A Single Channel or 1-A Four Channels with the PWP and 1.9-A Single Channel or 0.9-A Four Channels with the DYZ package at 25°C on standard FR-4 PCBs. The maximum RMS current varies based on PCB design and the ambient temperature.

8.2.3 Application Curves

Figure 8-2. Current Ramp With a 16-Ω, 1-mH, R_L Load and $V_M = 8.2$ V

Figure 8-3. Current Ramp With a 16-Ω, 1-mH R_L Load and $V_M = 30$ V

Figure 8-5. OCP Separated by t_{RETRY} With $V_M = 8.2$ V and OUT1 Shorted to V_M

Power Supply Recommendations

8.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system.
- The power supply's capacitance and ability to source current.
- The amount of parasitic inductance between the power supply and motor system.
- The acceptable voltage ripple.
- The type of motor used (Brushed DC, Brushless DC, Stepper).
- The type of motor used (Brushed DC, Brushless DC, Stepper).

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

Figure 8-6. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

8.3 Layout

8.3.1 Layout Guidelines

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

- Small-value capacitors should be ceramic, and placed closely to device pins.
- The high-current device outputs should use wide metal traces.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias help dissipate the $I^2 \times R_{DS(on)}$ heat that is generated in the device.

8.3.2 Layout Example

Figure 8-7. Layout Recommendation

8.3.3 Thermal Considerations

The DRV8804 has thermal shutdown (TSD) as described in [Section 7.3.4.2](#). If the die temperature exceeds approximately 150°C, the device will be disabled until the temperature drops to a safe level.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

8.3.3.1 Power Dissipation

Power dissipation in the DRV8804 is dominated by the power dissipated in the output FET resistance, or $R_{DS(ON)}$. Average power dissipation of each FET when running a static load can be roughly estimated by [Equation 2](#).

$$P = R_{DS(ON)} \cdot (I_{OUT})^2 \quad (2)$$

where

- P is the power dissipation of one FET
- $R_{DS(ON)}$ is the resistance of each FET
- I_{OUT} is equal to the average current drawn by the load

Note that at start-up and fault conditions this current is much higher than normal running current; these peak currents and their duration also must be taken into consideration. When driving more than one load simultaneously, the power in all active output stages must be summed.

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

Note that $R_{DS(ON)}$ increases with temperature, so as the device heats, the power dissipation increases. This must be taken into consideration when sizing the heatsink.

8.3.3.2 Heatsinking

The DRV8804DW package uses a standard SOIC outline, but has the center pins internally fused to the die pad to more efficiently remove heat from the device. The two center leads on each side of the package should be connected together to as large a copper area on the PCB as is possible to remove heat from the device. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

In general, the more copper area that can be provided, the more power can be dissipated.

The DRV8804PWP (HTSSOP package) and the DRV8804DYZ (SOT-23-THN package) uses an exposed thermal pad. The exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, this can be accomplished by adding a number of vias to connect the thermal pad to the ground plane. On PCBs without internal planes, copper area can be added on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

For details about how to design the PCB, see TI Application Report, *PowerPAD Thermally Enhanced Package* (SLMA002), and TI Application Brief, *PowerPAD Made Easy* (SLMA004), available at www.ti.com.

9 Device and Documentation Support

9.1 Documentation Support

9.1.1 Related Documentation

For related documentation see the following:

10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (December 2015) to Revision G (December 2024) Page

- Added DRV8804DYZ device to the data sheet. [1](#)

Changes from Revision E (January 2014) to Revision F (December 2015) Page

- Changed Catch Diodes to Clamp Diodes in *Features* [1](#)
- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section [1](#)

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OUTLINE

DYZ0016A SOT-23-THIN - 1.1 mm max height

PLASTIC SMALL OUTLINE

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
5. Reference JEDEC Registration MO-345, Variation AA.

DYZ0016A
EXAMPLE BOARD LAYOUT
SOT-23-THIN - 1.1 mm max height

PLASTIC SMALL OUTLINE

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

DYZ0016A

EXAMPLE STENCIL DESIGN
SOT-23-THIN - 1.1 mm max height

PLASTIC SMALL OUTLINE

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
7. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
8. Size of metal pad may vary due to creepage requirement.
9. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.
