

## High Voltage Non-inductive Resistors

### WHVL Series

- Voltage ratings 11 to 67kV
- Non-inductive printed serpentine design
- Tolerance down to 0.1%
- TCR down to 15ppm
- VCR down to -0.04ppm/V
- Non-magnetic materials
- RoHS compliant

 All parts are Pb-free and comply with EU Directive 2011/65/EU (RoHS2)

The technical drawing illustrates the component's geometry. It features a central rectangular body with rounded ends, shaded in gray. A horizontal line passes through the center of this body. Dimension L1 is the length of the central body. Dimension L is the total length of the component, including the mounting tabs. Dimension D is the height of the central body. Dimension f is the distance from the center of the body to the end of the mounting tab. Dimension d is the thickness of the mounting tab. Arrows indicate the direction of measurement for each dimension.

### Construction

Termination conductors and ruthenium oxide resistive material are printed in a non-inductive pattern onto the surface of a 96% alumina rod to which termination caps and terminal wires are then attached. The body of the resistor is then conformally coated either in silicone (protection code C) or in epoxy (protection code P).

### Terminations

The termination wires are gold plated.

### Marking

Type reference, resistance value and tolerance are legend marked. The resistance value code conforms to IEC 62.

### Solvent Resistance

The body protection and marking are resistant to all normal industrial cleaning solvents suitable for printed circuits.

Application Notes

Due to the high voltage which can appear between the end cap and any adjacent metal part, resistors should be mounted at an adequate distance from other conductors.

For some ultra-high voltage applications it is required to immerse the components in oil or SF<sub>6</sub> gas or pot them in void-free silicone compound to reduce corona or surface tracking. The epoxy protection, code P, is suitable for these applications.

The axial termination should not be bent closer than twice the diameter of the terminal wire from the resistor body.
