Description

The SKY13290-313LF is a PHEMT IC high-power SPDT switch. This high-power switch has been designed for use from 500 MHz–2.5 GHz, where low loss, high isolation, low control voltage and ultraminiature package size are required. It can be controlled with positive, negative or a combination of both voltages. The RF signal paths within the SKY13290-313LF are fully bilateral.

Some standard implementations include T/R switching for telematic applications at elevated power levels.

Switching is controlled via two control voltage inputs. Depending upon the voltage level applied to the control voltage pins, the common RF port (J_1) is connected to one of two RF ports (J_2 or J_3) via a low insertion loss path, while the path between J_1 and the other RF port is in its isolation state. When the control voltages are toggled, the states between J_1 and J_2 , as well as J_1 and J_3 , are also toggled.

The SKY13290-313LF is available in a lead (Pb)-free, RoHS-compliant, QFN-6 2 x 3 mm plastic package.

An evaluation board is available upon request.

NEW

Absolute Maximum Ratings

Characteristic	Value
Control voltage range	$0 \leq V_C \leq 10 \text{ V}$
RF input power	43.5 dBm, $f > 900 \text{ MHz}$
Operating temperature	-40°C to $+85^\circ\text{C}$

Performance is guaranteed only under the conditions listed in the specifications table and is not guaranteed under the full range(s) described by the Absolute Maximum specifications. Exceeding any of the absolute maximum/minimum specifications may result in permanent damage to the device and will void the warranty.

CAUTION: Although this device is designed to be as robust as possible, ESD (Electrostatic Discharge) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions must be employed at all times.

Pin Descriptions

Pin Number	Pin Name	Description
1	J_2	RF Input/Output – RF input/output port which is either connected to J_1 via a low insertion loss path or isolated from J_1 , according to the logic voltage levels applied to V_1 and V_2 .
2	GND	Equipotential Point – Internal circuit common, which must be connected to the pcb ground or common via the lowest possible impedance.
3	J_3	RF Input/Output – RF input/output port which is either connected to J_1 via a low insertion loss path or isolated from J_1 , according to the logic voltage levels applied to V_1 and V_2 .
4	V_2	Control Voltage 2 – Control voltage input #2. The logic voltage level applied to this pin, along with the voltage level applied to V_1 (pin 6), determines the states of the RF paths between J_1-J_2 and J_1-J_3 .
5	J_1	RF Common Input/Output – RF common input/output port which is either connected to J_2 or to J_3 via a low insertion loss and isolated from the other RF port, according to the logic voltage levels applied to V_1 and V_2 .
6	V_1	Control Voltage 1 – Control voltage input #1. The logic voltage level applied to this pin, along with the voltage level applied to V_2 (pin 4), determines the states of the RF paths between J_1-J_2 and J_1-J_3 .

Evaluation Board

The evaluation board for the SKY13290-313 allows the switch to be fully exercised. The RF common port is marked “J₁”, and the two switched RF ports are marked “J₂” and “J₃”. All of the RF ports have SMA connectors mounted. The control voltage inputs are marked “V₁” and “V₂”.

The printed circuit board material is Rogers 4003. The RF dielectric layer is 0.012 inches thick, ½ oz. copper. The RF transmission lines are each 50 Ω (nominal) microstrip.

There are three DC blocking capacitors on the board, C₁, C₂ and C₃, each of which is in series with one of the RF ports. These capacitors are 47 pF. For improved insertion loss at signal frequencies below approximately 500 MHz these capacitors should be replaced with larger capacitance capacitors, such as 1000 pF.
