

FEATURES

- *Guaranteed* 150 μ V max. Offset Voltage
- *Guaranteed* 1.8 μ V/ $^{\circ}$ C max. Offset Voltage Drift with Temperature
- *Excellent* 2.0 μ V/Month max. Long Term Stability
- *Guaranteed* 0.65 μ Vp-p max. Noise
- *Guaranteed* 7nA max. Input Bias Current

APPLICATIONS

- Thermocouple Amplifiers
- Strain Gauge Amplifiers
- Low Level Signal Processing
- Medical Instrumentation

DESCRIPTION

The OP-07 offers excellent performance in applications requiring low offset voltage, low drift with time and temperature and very low noise. Linear's OP-07 is interchangeable with many of the precision op amp device types. The OP-07 also offers a wide input voltage range, high common-mode rejection and low input bias current. These features result in optimum performance for small signal level and low frequency applications. Use of advanced design, processing and testing techniques make Linear's OP-07 a superior choice over similar products. A buffered reference application is shown below. For single op amp applications requiring higher performance in the SO package, see the LT1001CS8.

Precision Buffered Single Supply Reference

The OP-07 contributes less than 5% of the total drift with temperature, noise and long term drift of the reference application.

Long Term Stability of Four Representative Units

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	$\pm 22\text{V}$
Differential Input Voltage	$\pm 30\text{V}$
Input Voltage Equal to Supply Voltage	
Output Short Circuit Duration	Indefinite
Operating Temperature Range	0°C to 70°C
Storage Temperature Range	
All Devices	-65°C to 150°C
Lead Temperature (Soldering, 10 sec.)	300°C

The ● denotes specifications which apply over the full operating temperature range.

Note 1: Offset voltage is measured with high speed test equipment, approximately 1 second after power is applied.

Note 2: This parameter is tested on a sample basis only.

Note 3: Long Term Input Offset Voltage Stability refers to the averaged trend line of V_{OS} versus Time over extended periods after the first 30 days of operation. Excluding the initial hour of operation, changes in V_{OS} during the first 30 operating days are typically 2.5 μV .

Note 4: This parameter is guaranteed by design.
