**SN74AUP1G06**

SCES590E –JULY 2004–REVISED MARCH 2018

# SN74AUP1G06 Low-Power Single Inverter With Open-Drain Outputs

## 1 Features

- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Performance Tested Per JESD 22
  - 2000-V Human-Body Model (A114-B, Class II)
  - 1000-V Charged-Device Model (C101)
- Available in the Texas Instruments NanoStar™ Package
- Low Static-Power Consumption ($I_{CC}$ = 0.9 µA Maximum)
- Low Dynamic-Power Consumption ($C_{pd}$ = 1 pF Typical at 3.3 V)
- Low Input Capacitance ($C_i$ = 1.5 pF Typical)
- Low Noise – Overshoot and Undershoot <10% of $V_{CC}$
- $I_{off}$ Supports Partial Power-Down-Mode Operation
- Input Hysteresis Allows Slow Input Transition and Better Switching Noise Immunity at the Input ($V_{hys}$ = 250 mV Typical at 3.3 V)
- Wide Operating $V_{CC}$ Range of 0.8 V to 3.6 V
- Optimized for 3.3-V Operation
- 3.6-V I/O Tolerant to Support Mixed-Mode Signal Operation
- $t_{pd}$ = 3.6 ns Maximum at 3.3 V
- Suitable for Point-to-Point Applications

## 2 Applications

- AV Receivers
- Smartphones
- Blu-ray Players and Home Theaters
- Desktop or Notebook PCs
- Embedded PCs
- GPS: Personal Navigation Devices
- Mobile Internet Devices
- Network Projector Front-Ends
- Portable Media Players
- Smoke Detectors
- Solid State Drive (SSD): Enterprise
- High-Definition (HDTV)
- Tablets: Enterprise
- Audio Docks: Portable

## 3 Description

The AUP family is TI's premier solution to the industry's low-power needs in battery-powered portable applications. This family ensures a very low static and dynamic power consumption across the entire $V_{CC}$ range of 0.8 V to 3.6 V, resulting in an increased battery life. This product also maintains excellent signal integrity (see

*AUP – The Lowest-Power Family* and *Excellent Signal Integrity*).

### Device Information[1]

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|---|---|---|
| SN74AUP1G06DBV | SOT-23 (5) | 2.90 mm × 1.60 mm |
| SN74AUP1G06DCK | SC70 (5) | 2.00 mm × 1.25 mm |
| SN74AUP1G06DRL | SOT-5X3 (5) | 1.60 mm × 1.20 mm |

# 6 Specifications

## 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

|  |  | MIN | MAX | UNIT |
|---|---|---|---|---|
| Supply voltage, $V_{CC}$ |  | −0.5 | 4.6 | V |
| Input voltage[2], $V_I$ |  | −0.5 | 4.6 | V |
| Voltage range applied to any output in the high-impedance or power-off state[2], $V_O$ |  | −0.5 | 4.6 | V |
| Output voltage range in the high or low state[2], $V_O$ |  | −0.5 | $V_{CC}$ + 0.5 | V |
| Input clamp current, $I_{IK}$ | $V_I < 0$ |  | −50 | mA |
| Output clamp current, $I_{OK}$ | $V_O < 0$ |  | −50 | mA |
| Continuous output current, $I_O$ |  |  | ±20 | mA |
| Continuous current through $V_{CC}$ or GND |  |  | ±50 | mA |
| Junction temperature, $T_j$ |  |  | 150 | °C |
| Storage temperature, $T_{stg}$ |  | −65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

## 6.2 ESD Ratings

|  |  |  | VALUE | UNIT |
|---|---|---|---|---|
| $V_{(ESD)}$ | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1] | 2000 | V |
|  |  | Charged-device model (CDM), per JEDEC specification JESD22-C101[2] | 1000 |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

# 8 Detailed Description

## 8.1 Overview

The output of this single inverter buffer/driver is open drain, and can be connected to other open-drain outputs to implement active-low wired-OR or active-high wired-AND functions.

NanoStar™ package technology is a major breakthrough in IC packaging concepts, using the die as the package.

This device is fully specified for partial-power-down applications using $I_{off}$. The $I_{off}$ circuitry disables the outputs when the device is powered down. This inhibits current backflow into the device which prevents damage to the device.

## 8.2 Functional Block Diagram

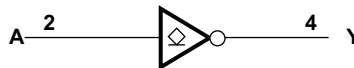

**Figure 5. Logic Diagram (Positive Logic)**

## 8.3 Feature Description

### 8.3.1 CMOS Open-Drain Outputs

The open-drain output allows the device to sink current to GND but not to source current from VCC. When the output is not actively pulling the line low, it will go into a high impedance state (3-state). This allows the device to be used for a wide variety of applications, including up-translation and down-translation, as the output voltage can be determined by an external pullup.

The drive capability of this device creates fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. It is important for the power output of the device to be limited to avoid thermal runaway and damage due to over-current. The electrical and thermal limits defined the in the *Absolute Maximum Ratings* must be followed at all times.

### 8.3.2 Standard CMOS Inputs

Standard CMOS inputs are high impedance and are typically modelled as a resistor in parallel with the input capacitance given in the *Electrical Characteristics*. The worst case resistance is calculated with the maximum input voltage, given in the *Absolute Maximum Ratings*, and the maximum input leakage current, given in the *Electrical Characteristics*, using ohm's law (R = V ÷ I).

Signals applied to the inputs need to have fast edge rates, as defined by Δt/Δv in *Recommended Operating Conditions* to avoid excessive currents and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be utilized to condition the input signal prior to the standard CMOS input.

# Feature Description (continued)

## 8.3.3  Clamp Diodes

The inputs and outputs to this device have negative clamping diodes.

---

**CAUTION**

Voltages beyond the values specified in the *Absolute Maximum Ratings* table can cause damage to the device. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
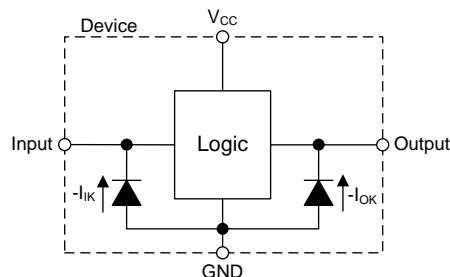

---

**Figure 6.  Electrical Placement of Clamping Diodes for Each Input and Output**

## 8.3.4  Partial Power Down ($I_{off}$)

The inputs and outputs for this device enter a high impedance state when the supply voltage is 0 V. The maximum leakage into or out of any input or output pin on the device is specified by $I_{off}$ in the *Electrical Characteristics*.

## 8.3.5  Over-voltage Tolerant Inputs

Input signals to this device can be driven above the supply voltage so long as they remain below the maximum input voltage value specified in the *Absolute Maximum Ratings*.

# 9 Application and Implementation

> **NOTE**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 9.1 Application Information

Open-drain devices are very commonly used for voltage level translation. In this application, the SN74AUP1G06 is used to translate a 1.8-V output from device A to a 3.3-V input on device B.

## 9.2 Typical Application

The application schematic shown in Figure 7 includes two generic devices, labeled as "Device A" and "Device B."

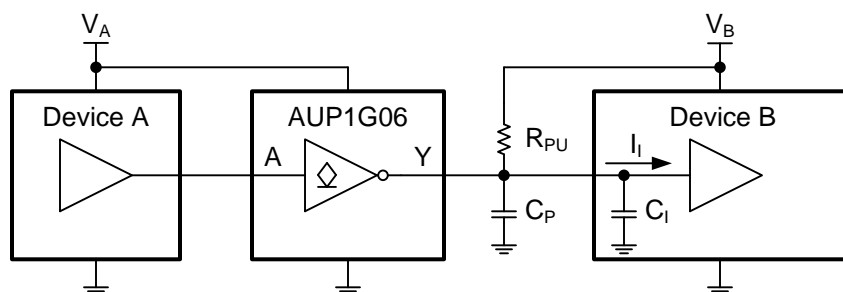

**Figure 7. Application schematic for voltage translation with SN74AUP1G06**

### 9.2.1 Design Requirements

This device has a standard CMOS input, so be careful to avoid slow or floating inputs that might cause oscillation or excessive current. Please see the *Implications of Slow or FLoating CMOS Inputs* Application Report.

This device has an open-drain output, which means that the output enters a high-impedance state when a normal CMOS device would drive the output high. A pull-up resistor must be added to the output for an open-drain device to have a high output. The selection of this pull-up resistor is detailed in the next section.

### 9.2.2 Detailed Design Procedure

1. Recommended Input Conditions
   - For specified high and low levels, see $V_{IH}$ and $V_{IL}$ in the *Electrical Characteristics* table.
   - Inputs are overvoltage tolerant allowing them to go as high as $V_{I(max)}$ in the *Absolute Maximum Ratings* table at any valid $V_{CC}$.
2. Recommended Output Conditions
   - Output voltage must not exceed $V_{O(max)}$ as specified in the *Absolute Maximum Ratings* table.
   - Pull-up resistor (R) selection depends on three primary factors: desired output high voltage ($V_{OH}$), which is directly related to total leakage current into the SN74AUP1G240 and the peripheral device's input ($I_L$), desired 0 to 90% rising edge time ($t_r$), which is directly related to the parasitic line capacitance ($C_P$), and the maximum current during low output ($I_{OL}$), which is directly related to the supply value. These three equations govern pull-up resistor selection:
     - $R \leq ( V_{CC} - V_{OH} ) / I_L$
     - $R \leq t_r / ( 2.3 * C_P )$
     - $R \geq V_{CC} / I_{OL(max)}$

# 10  Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the *Recommended Operating Conditions* table.

Each $V_{CC}$ pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a 0.1-µF capacitor is recommended and if there are multiple $V_{CC}$ pins then a 0.01-µF or 0.022-µF capacitor is recommended for each power pin. It is ok to parallel multiple bypass caps to reject different frequencies of noise. 0.1-µF and 1-µF capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power pin as possible for best results.

# 11  Layout

## 11.1  Layout Guidelines

Even low data rate digital signals can contain high-frequency signal components due to fast edge rates. When a printed-circuit board (PCB) trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self–inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. Figure 9 shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

An example layout is given in Figure 10 for the DPW (X2SON-5) package. This example layout includes a 0402 (metric) capacitor and uses the measurements found in the example board layout appended to this end of this datasheet. A via of diameter 0.1 mm (3.973 mil) is placed directly in the center of the device. This via can be used to trace out the center pin connection through another board layer, or it can be left out of the layout

## 12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**(1)** The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

**(2)** **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

**(3)** MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**(4)** There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

**(5)** Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

**(6)** Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
