

Features

- Internal digital controlled crystal oscillator (DCXO) for continuous glitch-free operation
- Zero input-output propagation delay
- Low-jitter (35 ps max RMS) outputs
- Low output-to-output skew (200 ps max)
- 4.17 MHz to 166.7 MHz reference input
- Supports industry standard input crystals
- 166.7 MHz outputs
- 5V-tolerant inputs
- Phase-locked loop (PLL) bypass mode
- Dual reference inputs
- 16-Pin thin shrunk small outline package (TSSOP)
- 2.5 V or 3.3 V output power supplies
- 3.3 V core power supply
- Industrial temperature range

Functional Description

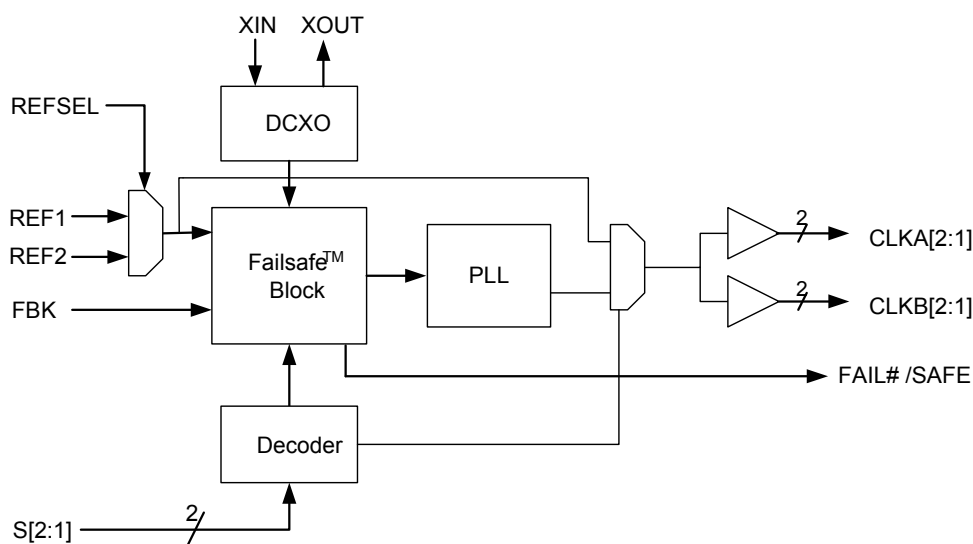

The CY23FS04-3 is a FailSafe™ zero delay buffer with two reference clock inputs and four phase-aligned outputs. The device provides an optimum solution for applications where continuous operation is required in the event of a primary clock failure.

The continuous, glitch-free operation is achieved by using a DCXO, which serves as a redundant clock source in the event of a reference clock failure by maintaining the last frequency and phase information of the reference clock.

The unique feature of the CY23FS04-3 is that the DCXO is in fact the primary clocking source, which is synchronized (phase-aligned) to the external reference clock. When this external clock is restored, the DCXO automatically resynchronizes to the external clock.

The frequency of the crystal that is connected to the DCXO must be an integer factor of the frequency of the reference clock. This factor is set by two select lines: S[2:1], see [Table 2](#). The output power supply V_{DD} can be connected to either 2.5 V or 3.3 V. V_{DDC} is the power supply pin for internal circuits and must be connected to 3.3 V.

Pin Configuration

Figure 1. Pin Diagram - CY23FS04-3 16-Pin TSSOP

Table 1. Pin Definition

Pin No.	Pin Name	Description
2, 1	REF[2:1]	Reference clock inputs. 5V-tolerant. ^[4]
4, 3	CLKB[2:1]	Bank B clock outputs. ^[1,2]
13, 14	CLKA[2:1]	Bank A clock outputs. ^[1,2]
15	FBK	Feedback input to the PLL. ^[1,4]
5, 12	S[2:1]	Frequency select pins and PLL and DCXO bypass mode. ^[3]
8	XIN	Reference crystal input.
9	XOUT	Reference crystal output.
10	FAIL#/SAFE	Valid reference indicator. A high level indicates a valid reference input.
11	VDD	2.5-V or 3.3-V power supply.
7	VDDC	3.3-V power supply.
6	VSS	Ground.
16	REFSEL	Reference select. Selects the active reference clock from either REF1 or REF2. REFSEL = 1, REF1 is selected; REFSEL = 0, REF2 is selected.

Table 2. Configuration Table

S[2:1]	XTAL (MHz)		REF (MHz)		OUT (MHz)		REF:OUT Ratio	REF:XTAL Ratio	Out:XTAL Ratio
	Min	Max	Min	Max	Min	Max			
00			PLL and DCXO Bypass Mode						
01	8.33	30.00	4.17	15.00	4.17	15.00	×1	1/2	1/2
10	8.00	25.00	16.00	50.00	16.00	50.00	×1	2	2
11	8.33	27.78	50.00	166.70	50.00	166.70	×1	6	6

Notes

- For normal operation, connect either one of the four clock outputs to the FBK input.
- Weak pull downs on all outputs.
- Weak pull ups on these inputs.
- Weak pull down on these inputs

FailSafe Function

The CY23FS04-3 is targeted at clock distribution applications that require continued operation should the main reference clock fail. Existing approaches to this requirement have used multiple reference clocks with either internal or external methods for switching between references. The problem with this technique is that it leads to interruptions (or glitches) when transitioning from one reference to another, often requiring complex external circuitry or software to maintain system stability. The technique implemented in this design completely eliminates any switching of references to the PLL, greatly simplifying system design.

The CY23FS04-3 PLL is driven by the crystal oscillator, which is phase-aligned to an external reference clock so that the output of the device is effectively phase-aligned to the reference via the external feedback loop. This is accomplished by using a digitally controlled capacitor array to pull the crystal frequency over an approximate range of ± 300 ppm from its nominal frequency.

In this mode, if the reference frequency fails (stop or disappear), the DCXO maintains its last setting and a flag signal (FAIL#/SAFE) is set to indicate failure of the reference clock.

The CY23FS04-3 provides two select bits, S1 and S2, to control the reference-to-crystal frequency ratio. The DCXO is internally tuned to the phase and frequency of the external reference only when the reference frequency divided by this ratio is within the DCXO capture range. If the frequency is out of range, a flag is set on the FAIL#/SAFE pin notifying the system that the selected reference is not valid. If the reference moves in range, then the flag is cleared, indicating to the system that the selected reference is valid.

Figure 2. Fail#/Safe Timing for Input Reference Failing Catastrophically

Figure 3. Fail#/Safe Timing Formula

$$t_{FSL(max)} = 2 (t_{REF} \times n) + 25 ns$$

$$n = \frac{F_{REF}}{F_{XTAL}} = 4 \text{ (in above example)}$$

$$t_{FSH(min)} = 12 (t_{REF} \times n) + 25 ns$$

Table 3. FailSafe Timing Table

Parameter	Description	Conditions	Min	Max	Unit
t_{FSL}	Fail#/Safe Assert Delay	Measured at 80% to 20%, Load = 15 pF	–	See Figure 3	ns
t_{FSH}	Fail#/Safe Deassert Delay	Measured at 80% to 20%, Load = 15 pF	See Figure 3	–	ns

Figure 5. FailSafe Reference Switching Behavior

FailSafe typical frequency settling time

Initial valid Ref1=20MHz + 100ppm,
then switching to REF2=20MHz

Because of the DCXO architecture, the CY23FS04-3 has a much lower bandwidth than a typical PLL-based clock generator. This is shown in Figure 6. This low bandwidth makes the CY23FS04-3 also useful as a jitter attenuator. The loop bandwidth curve is also known as the jitter transfer curve.

XTAL Selection Criteria and Application Example

Choosing the appropriate XTAL ensures the FailSafe device is able to span an appropriate frequency of operation. Also, the XTAL parameters determine the holdover frequency stability. Critical parameters are given here. Cypress recommends that you choose:

- Low C0/C1 ratio (240 or less) so that the XTAL has enough range of pullability
- Low temperature frequency variation
- Low manufacturing frequency tolerance
- Low aging

Example:

$$C_{LOADMIN} = (12 \text{ pF IC input cap} + 0 \text{ pF pulling cap} + 6 \text{ pF trace cap on board}) / 2 = 9 \text{ pF}$$

$$C_{LOADMAX} = (12 \text{ pF IC input cap} + 48 \text{ pF pulling cap} + 6 \text{ pF trace cap on board}) / 2 = 33 \text{ pF}$$

$$\text{Pull Range} = (f_{C_{LOADMIN}} - f_{C_{LOADMAX}}) / f_{C_{LOADMIN}} = (C1 / 2) * [(1 / (C0 + C_{LOADMIN})) - (1 / (C0 + C_{LOADMAX}))]$$

$$\text{Pull Range in ppm} = (C1 / 2) * [(1 / (C0 + C_{LOADMIN})) - (1 / (C0 + C_{LOADMAX}))] * 10^6$$

C0 is the XTAL shunt capacitance (3 pF–7 pF typ).

C1 is the XTAL motional capacitance (10 fF–30 fF typ).

The capacitive load as “seen” by the XTAL is across its terminals. It is named $C_{LOADMIN}$ (for minimum value), and $C_{LOADMAX}$ (for maximum value). These are used to calculate the pull range.

Note that the C_{LOAD} range “center” is approximately 20 pF, but you may not want a XTAL calibrated to that load. This is because the pullability is not linear, as represented in the equation above. Plotting the pullability of the XTAL shows this expected behavior as shown in [Figure 13](#). In this example, specifying a XTAL calibrated to 14 pF load provides a balanced ppm pullability range around the nominal frequency.

Figure 13. Frequency vs. C_{LOAD} Behavior for Example XTAL

Table 4. Pullability Range of XTAL with Different C0/C1 Ratio

C0/C1 Ratio	$C_{LOAD}(\min)$	$C_{LOAD}(\max)$	Pullability Range	
200	8.0	32.0	-385	333
300	8.0	32.0	-256	222
400	8.0	32.0	-192	166

Calculated value of the pullability range for the XTAL with C0/C1 ratio of 200, 300, and 400 are shown in Table 4. For this calculation $C_{LOAD}(\min) = 8$ pF and $C_{LOAD}(\max) = 32$ pF is used. Using a XTAL that has a nominal frequency specified at load capacitance of 14 pF, almost symmetrical pullability range is obtained.

Next, it is important to calculate the pullability range including error tolerances. This is the capture range of the input reference frequency that the FailSafe device and XTAL combination can reliably span.

Calculating the capture range involves subtracting error tolerances as follows:

Parameter.....	f error (ppm)
Manufacturing frequency tolerance	15
Temperature stability	30
Aging	3
Board/trace variation	5
Total	53

Example: Capture Range for XTAL with C0/C1 Ratio of 200

Negative Capture Range = $-385 \text{ ppm} + 53 \text{ ppm} = -332 \text{ ppm}$

Positive Capture Range = $333 \text{ ppm} - 53 \text{ ppm} = +280 \text{ ppm}$

It is important to note that the XTAL with lower C0/C1 ratio has wider pullability/capture range as compared to the higher C0/C1 ratio. This helps to select the appropriate XTAL for use in the FailSafe application.

Absolute Maximum Conditions

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Parameter	Description	Condition	Min	Max	Unit
V _{DD}	Supply voltage		−0.5	4.6	V
V _{IN}	Input voltage	Relative to V _{SS}	−0.5	V _{DD} +0.5	VDC
T _S	Temperature, Storage	Non Functional	−65	150	°C
T _J	Temperature, Junction	Functional	−	125	°C
ESD _{HBM}	ESD protection (human body model)	MIL-STD-883, Method 3015	2000	−	V
Ø _{JC}	Dissipation, junction to case	Mil-Spec 883E Method 1012.1	29.87		°C/W
Ø _{JA}	Dissipation, junction to ambient	JEDEC (JESD 51)	120.11		°C/W
UL−94	Flammability rating	At 1/8 in.	V−0		
MSL	Moisture sensitivity level		3		
Multiple Supplies: The voltage on any input or I/O pin cannot exceed the power pin during power up. Power supply sequencing is NOT required.					

Recommended Pullable Crystal Specifications^[5]

Parameter	Name	Comments	Min	Typ	Max	Unit
F _{NOM}	Nominal crystal frequency	Parallel resonance, fundamental mode, AT cut	8.00	−	30.00	MHz
C _{LOADNOM}	Nominal load capacitance		−	14	−	pF
R ₁	Equivalent series resistance (ESR)	Fundamental mode	−	−	25	Ω
R ₃ /R ₁	Ratio of third overtone mode ESR to fundamental mode ESR	Ratio used because typical R ₁ values are much less than the maximum spec	3	−	−	
DL	Crystal drive level	No external series resistor assumed	−	0.5	2	mW
F _{3SEPLI}	Third overtone separation from 3*F _{NOM}	High side	300	−	−	ppm
F _{3SEPLO}	Third overtone separation from 3*F _{NOM}	Low side	−	−	−150	ppm
C ₀	Crystal shunt capacitance		−	−	7	pF
C ₀ / C ₁	Ratio of shunt to motional capacitance		180	−	250	
C ₁	Crystal motional capacitance		14.4	18	21.6	fF

Operating Conditions for FailSafe Devices

Parameter	Description	Min	Max	Unit
V _{DDC}	3.3-V supply voltage	3.135	3.465	V
V _{DD}	2.5-V supply voltage range	2.375	2.625	V
	3.3-V supply voltage range	3.135	3.465	V
T _A	Ambient operating temperature, Industrial	−40	85	°C
C _L	Output load capacitance (F _{out} ≤ 100 MHz)	−	30	pF
	Output load capacitance (F _{out} > 100 MHz)	−	15	pF
C _{IN}	Input capacitance (except XIN)	−	7	pF
C _{XIN}	Crystal input capacitance (all internal caps off)	10	13	pF
T _{PU}	Power-up time for all V _{DD} s to reach minimum specified voltage (power ramps must be monotonic)	0.05	500	ms
