

Secondary Side Average Current Mode Controller

FEATURES

- Practical Secondary Side Control of Isolated Power Supplies
- Provides a Self Regulating Bias Supply From a High Input Voltage Using an External N-Channel Depletion Mode FET
- Onboard Precision, Fixed Gain, Differential Current Sense Amplifier
- Wide Bandwidth Current Error Amplifier
- 5V Reference
- High Current, Programmable Gm Amplifier Optimized to Drive Opto-couplers

DESCRIPTION

The UCC3839 provides the control functions for secondary side average current mode control in isolated power supplies. Start up, pulse width modulation and MOSFET drive must be accomplished independently on the primary side. Communication from secondary to primary side is anticipated through an opto-isolator.

Accordingly, the UCC3839 contains a fixed gain current sense amplifier, voltage and current error amplifiers, and a Gm type buffer/driver amplifier for the opto-isolator. Additional housekeeping functions include a precision 5V reference and a bias supply regulator.

Power for the UCC3839 can be generated by peak rectifying the voltage of the secondary winding of the isolation transformer. From this unregulated voltage, the UCC3839's bias supply regulator will generate its own 7.5V bias supply using an external, N-channel, depletion mode FET.

The UCC3839 can be configured for traditional average current mode control where the output of the voltage error amplifier commands the current error amplifier. It can also be configured for output voltage regulation with average current mode short circuit current limiting, employing two parallel control loops regulating the output voltage and output current independently.

BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	15V
Supply Current (LED not connected)	2mA
(LED connected)	14mA
Analog Inputs	-0.3V to 15V
Power Dissipation at $T_A = 60^\circ\text{C}$ (LED not connected)	20mW
(LED connected)	55mW
Storage Temperature	-65°C to +150°C
Junction Temperature	-55°C to +150°C
Lead Temperature (Soldering, 10sec.)	+300°C

Currents are positive into, negative out of the specified terminal. Consult Packaging Section of Databook for thermal limitations and considerations of package.

D or N Package

ELECTRICAL CHARACTERISTICS: Unless otherwise specified, 0°C to 70°C for the UCC3839, -40°C to 85° for the UCC2839. $V_{\text{LINE}} = 10\text{V}$, $R_G = 400\Omega$, $T_A = T_J$.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS
Current Error Amplifier					
VIO				10	mV
AVOL		60			dB
CMRR	$V_{\text{CM}} = 0.5\text{V}$ to 5.5V	60			dB
PSRR	$V_{\text{LINE}} = 10\text{V}$ to 20V	60			dB
CAO High	$CA- = 1\text{V}$, $CA+ = 1.1\text{V}$, $I_{\text{CAO}} = -100\mu\text{A}$	4.8	7		V
I_{CAO}	$CA- = 1\text{V}$, $CA+ = 1.1\text{V}$, $CAO = 0.5\text{V}$	-500		-250	μA
CAO Low	$CA- = 1\text{V}$, $CA+ = 0.9\text{V}$, $I_{\text{CAO}} = 500\mu\text{A}$		0.2	0.4	V
GBW	$F = 100\text{kHz}$, $T_A = 25^\circ\text{C}$	3	5		MHz
Voltage Error Amplifier					
VA-		1.46	1.5	1.525	V
AVOL		60			dB
PSRR	$V_{\text{LINE}} = 10\text{V}$ to 20V	60			dB
VAO High	$I_{\text{VAO}} = -100\mu\text{A}$ to $100\mu\text{A}$	4.8	5	5.2	V
I_{VAO}	$VA- = 1.45\text{V}$, $VAO = 0.5\text{V}$	-500		-250	μA
VAO Low	$VA- = 1.55\text{V}$, $VAO = 0.5\text{V}$, $I_{\text{VAO}} = 500\mu\text{A}$		0.2	0.4	V
GBW	(Note 1)	3	5		MHz
Current Sense Amplifier					
CSO Zero	$CS+ = CS- = -0.3\text{V}$ to 5.5V , $I_{\text{CSO}} = -100\mu\text{A}$ to $100\mu\text{A}$	0.85	1	1.15	V
AV	$CS+ = 0$, $CS- = 0\text{mV}$ to -200mV	7.75	8	8.2	V/V
Current Sense Amplifier (cont.)					
Slew Rate	$CS+ = 0$, $CS- = 0\text{mV}$ to -0.5V	2	4		$\text{V}/\mu\text{s}$
CSO	$CS+ = -200\text{mV}$, $CS- = -700\text{mV}$	4.75	5	5.2	V
LED Driver					
I _{LED}	LED = 5.5V , $CA- = 1\text{V}$, $CA+ = 1.1\text{V}$, $R_G = 400$		0	10	μA
	LED = 5.5V , $CA- = 1\text{V}$, $CA+ = 0.9\text{V}$, $R_G = 400$	9	10	11	mA
Gm	LED = 5.5V , $CAO = 1\text{V}$ to 3V , $R_G = 400$	2.25	2.5	2.75	mS
Slew Rate	CAO = 2V to 2.5V , LED = 400Ω to 5.5V , $R_G = 400$	1	4		$\text{V}/\mu\text{s}$

ELECTRICAL CHARACTERISTICS: Unless otherwise specified, 0°C to 70°C for the UCC3839, -40°C to 85° for the UCC2839. $V_{LINE} = 10V$, $R_G = 400\Omega$, $T_A = T_J$.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS
Precision Reference					
REF	$T_J = 25^\circ C$	4.94	5	5.06	V
	$I_{REF} = 0mA$ to $1mA$, $V_{LINE} = 10V$ to $20V$	4.9		5.1	V
VA+/REF			0.298	0.3	0.302
VDD Regulator					V/V
VDD	$I_{DD} = 0mA$ to $-15mA$, $V_{LINE} = 10V$ to $40V$	7	7.5	8	V
IVDD	$V_{LINE} = 10V$ to $40V$, $CA- = 0V$, $CA+ = 1V$, $VA- = 2.9V$, $CS+ = CS- = 0$, $I_{REF} = 0$		1.3	2	mA

Note 1: Ensured by design. Not 100% tested in production.

PIN DESCRIPTIONS

CA-: Current Error Amplifier Negative Input.

CAO: Current Error Amplifier Output. Output source current is limited, and output sink current is guaranteed to be greater than the VAO output source current. Current loop compensation components are generally connected to CAO and CA-.

CA+: Current Error Amplifier Positive Input.

CS-: Current Sense Amplifier Negative Input.

CSO: Current Sense Amplifier Output. Internally set gain $V_{OUT}/V_{IN} = 8$ $V_{IN} = 0V$ results in CSO = 1V.

CS+: Current Sense Amplifier Positive Input.

GM: Gm (transconductance) Programming Pin. Resistor $R_{GM} = 400\Omega$ to GND.

GND: Chip Ground.

LED: Output of LED Driver. Connect LED from VDD pin to LED.

REF: 5V Precision Reference Buffer Output. Minimum Decoupling Capacitance = $0.01\mu F$

VA-: Voltage Error Amplifier Negative Input. Voltage Error Amplifier is internally referenced to 1.5V

VAO: Voltage Error Amplifier Output. In a two loop average current mode control configuration, VAO is connected to CA+ and is the current command signal. VAO is internally clamped not to exceed 5V for short circuit control. In a single loop voltage mode control configuration with a parallel average short circuit current control loop, VAO is connected directly to CAO. Output source current is limited, and output sink current is guaranteed to be greater than the CAO output source current.

VDD: 7.5V Regulator output. Supply for most of the chip. Minimum Decoupling Capacitance = $0.01\mu F$

VGATE: External FET Gate Control Voltage.

APPLICATION INFORMATION

Fig. 1 shows a typical secondary side average current mode controller configuration using the UCC3839. In this configuration, output voltage is sensed and regulated by the voltage error amplifier. Its output, VAO provides the reference for the current error amplifier at the CA+ pin. VAO can be connected to CA+ directly or through a resistive divider depending on the particular application requirements.

Average current mode control needs accurate output current information which is provided by a low value current sense resistor. The voltage proportional to the converter's output current is sensed and amplified by the

precision current sense amplifier of the chip. The onboard current sense amplifier has a gain of 8 and is intended for differential sensing of the shunt voltage with a common mode voltage range from 0V up to 5V. The output of the current sense amplifier, CSO is 1V for zero input which guarantees that the circuit can control currents down to 0A.

The CSO signal is fed to the CA- input of the current error amplifier through a resistor. The current error amplifier takes the VAO and CSO signals and generates the error signal for the pulse width modulator.

APPLICATION INFORMATION (cont.)

Since the PWM function is located on the primary side of the power converter the CAO signal must be sent across the safety isolation boundary. The UCC3839 anticipates an opto-coupler to provide isolation between primary and secondary. Therefore, CAO drives a transconductance amplifier that controls LED current in an opto-isolator. During start up and when CAO exceeds 4V, the current in the LED drops to zero. Maximum LED current is obtained during normal operation as CAO reaches its lowest potential. Its value is determined by the programming resistor value from the GM pin to circuit GND.

An alternative secondary side controller configuration is introduced in Fig. 2. In this circuit, the voltage and current control loops of the UCC3839 are connected parallel. It can be achieved by connecting the VAO and CAO pins together. The error amplifier with the lower output voltage

controls the current in the opto-coupler providing the feedback signal for the PWM section on the primary side. Voltage regulation is still maintained by the voltage error amplifier until a user programmable output current is reached. At this time CAO will take control over the Gm amplifier and the output current of the converter will be regulated while the output voltage falls below its nominal value. This current level is set at the CA+ input by a resistive divider from the 5V reference of the chip.

Since the chip is powered from a peak rectifier which maintains the bias supply for the UCC3839 even under short circuit conditions, both of these techniques can be used to eliminate the short circuit runaway problem in isolated power supplies using peak current mode control on the primary side.
