P-CHANNEL POWER MOSFET

SFP9Z34

The diagram illustrates a current regulator circuit. A 12V source is connected to a network of capacitors (200nF, 300nF) and resistors (50KΩ). This network drives the gate of a MOSFET (DUT). The MOSFET's source is connected to ground through a resistor R_1 (Current Sampling (I_G) Resistor). The drain is connected to a 12V source (V_{DS}) through a resistor R_2 (Current Sampling (I_D) Resistor). A pulse input of -3mA is shown at the gate. A second MOSFET, labeled "Same Type as DUT", is shown in a parallel configuration with the first one.
