Notes

- These are steady state limits. The factory should be consulted on applications involving pulsed or low duty cycle operations.
- These ratings give a maximum junction temperature of +85°C and junction to case thermal resistance of +300°C/W (derating factor of 3.33 mW/°C) and a junction to ambient thermal resistance of +600°C/W (derating factor of 1.67 mW/°C).
- Measured with radiation flux intensity of less than 0.1 $\mu\text{W}/\text{cm}^2$ over the spectrum from 100 to 1500 nm.
- Measured at noted irradiance as emitted from a tungsten filament lamp at a color temperature of 2854° K.
- No electrical connection to emitter lead.
- Measured with a tungsten lamp (2854° K) with a 950 nm filter.
- No electrical connection to base lead.
- Rise time is defined as the time required for I_{ce} to rise from 10% to 90% peak value. Fall time is defined as the time required for I_{ce} to decrease from 90% to 10% of peak value. Test conditions are I_{ce}=4.0 mA, V_{ce}=5.0 V, R_L=100 Ohms, GaAs Source.
