

# FAN7529

## Critical Conduction Mode PFC Controller

### Features

- Low Total Harmonic Distortion (THD)
- Precise Adjustable Output Over-Voltage Protection
- Open-Feedback Protection and Disable Function
- Zero Current Detector
- 150μs Internal Start-up Timer
- MOSFET Over-Current Protection
- Under-Voltage Lockout with 3.5V Hysteresis
- Low Start-up (40μA) and Operating Current (1.5mA)
- Totem Pole Output with High State Clamp
- +500/-800mA Peak Gate Drive Current
- 8-Pin DIP or 8-Pin SOP

### Applications

- Adapter
- Ballast
- LCD TV, CRT TV
- SMPS

### Related Application Notes

### Description

The FAN7529 is an active power factor correction (PFC) controller for boost PFC applications that operates in critical conduction mode (CRM). It uses the voltage mode PWM that compares an internal ramp signal with the error amplifier output to generate MOSFET turn-off signal. Because the voltage-mode CRM PFC controller does not need rectified AC line voltage information, it saves the power loss of the input voltage sensing network necessary for the current-mode CRM PFC controller.

FAN7529 provides many protection functions, such as over-voltage protection, open-feedback protection, over-current protection, and under-voltage lockout protection. The FAN7529 can be disabled if the INV pin voltage is lower than 0.45V and the operating current decreases to 65μA. Using a new variable on-time control method, THD is lower than the conventional CRM boost PFC ICs.

### Ordering Information

| Part Number | Operating Temp. Range | Pb-Free | Package | Packing Method | Marking Code |
|-------------|-----------------------|---------|---------|----------------|--------------|
| FAN7529N    | -40°C to +125°C       | Yes     | 8-DIP   | Rail           | FAN7529      |
| FAN7529M    | -40°C to +125°C       | Yes     | 8-SOP   | Rail           | FAN7529      |
| FAN7529MX   | -40°C to +125°C       | Yes     | 8-SOP   | Tape & Reel    | FAN7529      |

## Pin Definitions

| Pin # | Name            | Description                                                                                                                                                                                                                                                  |
|-------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | INV             | This pin is the inverting input of the error amplifier. The output voltage of the boost PFC converter should be resistively divided to 2.5V.                                                                                                                 |
| 2     | COMP            | This pin is the output of the transconductance error amplifier. Components for output voltage compensation should be connected between this pin and GND.                                                                                                     |
| 3     | MOT             | This pin is used to set the slope of the internal ramp. The voltage of this pin is maintained at 2.9V. If a resistor is connected between this pin and GND, current flows out of the pin and the slope of the internal ramp is proportional to this current. |
| 4     | CS              | This pin is the input of the over-current protection comparator. The MOSFET current is sensed using a sensing resistor and the resulting voltage is applied to this pin. An internal RC filter is included to filter switching noise.                        |
| 5     | ZCD             | This pin is the input of the zero current detection block. If the voltage of this pin goes higher than 1.5V, then goes lower than 1.4V, the MOSFET is turned on.                                                                                             |
| 6     | GND             | This pin is used for the ground potential of all the pins. For proper operation, the signal ground and the power ground should be separated.                                                                                                                 |
| 7     | OUT             | This pin is the gate drive output. The peak sourcing and sinking current levels are +500mA and -800mA respectively. For proper operation, the stray inductance in the gate driving path must be minimized.                                                   |
| 8     | V <sub>CC</sub> | This pin is the IC supply pin. IC current and MOSFET drive current are supplied using this pin.                                                                                                                                                              |

## Absolute Maximum Ratings

The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings.  $T_A=25^{\circ}\text{C}$  unless otherwise specified.

| Symbol           | Parameter                                                     | Value      | Unit               |
|------------------|---------------------------------------------------------------|------------|--------------------|
| $V_{CC}$         | Supply Voltage                                                | $V_Z$      | V                  |
| $I_{OH}, I_{OL}$ | Peak Drive Output Current                                     | +500/-800  | mA                 |
| $I_{clamp}$      | Driver Output Clamping Diodes $V_O > V_{CC}$ or $V_O < -0.3V$ | $\pm 10$   | mA                 |
| $I_{det}$        | Detector Clamping Diodes                                      | $\pm 10$   | mA                 |

## Applications Information

### 1. Error Amplifier Block

The error amplifier block consists of a transconductance amplifier, output OVP comparator, and disable comparator. For the output voltage control, a transconductance amplifier is used instead of the conventional voltage amplifier. The transconductance amplifier (voltage controlled current source) aids the implementation of OVP and disable function. The output current of the amplifier changes according to the voltage difference of the inverting and non-inverting input of the amplifier. The output voltage of the amplifier is compared with the internal ramp signal to generate the switch turn-off signal. The OVP comparator shuts down the output drive block when the voltage of the INV pin is higher than 2.675V and there is 0.175V hysteresis. The disable comparator disables the operation of the FAN7529 when the voltage of the inverting input is lower than 0.45V and there is 100mV hysteresis. An external small signal MOSFET can be used to disable the IC, as shown in Figure 33. The IC operating current decreases below 65μA to reduce power consumption if the IC is disabled.

Figure 33. Error Amplifier Block

### 2. Zero Current Detection Block

The zero current detector (ZCD) generates the turn-on signal of the MOSFET when the boost inductor current reaches zero using an auxiliary winding coupled with the inductor. If the voltage of the ZCD pin goes higher than 1.5V, the ZCD comparator waits until the voltage goes

below 1.4V. If the voltage goes below 1.4V, the zero current detector turns on the MOSFET. The ZCD pin is protected internally by two clamps, 6.7V-high clamp and 0.65V-low clamp. The 150μs timer generates a MOSFET turn-on signal if the drive output has been low for more than 150μs from the falling edge of the drive output.

Figure 34. Zero Current Detector Block

### 3. Sawtooth Generator Block

The output of the error amplifier and the output of the sawtooth generator are compared to determine the MOSFET turn-off instance. The slope of the sawtooth is determined by an external resistor connected to the MOT pin. The voltage of the MOT pin is 2.9V and the slope is proportional to the current flowing out of the MOT pin. The internal ramp signal has a 1V offset; therefore, the drive output is shut down if the voltage of the COMP pin is lower than 1V. The MOSFET on-time is maximum when the COMP pin voltage is 5V. According to the slope of the internal ramp, the maximum on-time can be programmed. The necessary maximum on-time depends on the boost inductor, lowest AC line voltage, and maximum output power. The resistor value should be designed properly.

Figure 35. Sawtooth Generator Block

#### 4. Over-Current Protection Block

The MOSFET current is sensed using an external sensing resistor for the over-current protection. If the CS pin voltage is higher than 0.8V, the over-current protection comparator generates a protection signal. An internal RC filter is included to filter switching noise.

Figure 36. Over-Current Protection Block

#### 5. Switch Drive Block

The FAN7529 contains a single totem-pole output stage designed for direct drive of the power MOSFET. The drive output is capable of up to +500/-800mA peak current with a typical rise and fall time of 50ns with 1nF load. The output voltage is clamped to 13V to protect the MOSFET gate if the  $V_{CC}$  voltage is higher than 13V.

#### 6. Under-Voltage Lockout Block

If the  $V_{CC}$  voltage reaches 12V, the IC's internal blocks are enabled and start operation. If the  $V_{CC}$  voltage drops below 8.5V, most of the internal blocks are disabled to reduce the operating current.  $V_{CC}$  voltage should be higher than 8.5V under normal conditions.

## Typical Application Circuit

| Application | Output Power | Input Voltage                               | Output Voltage |
|-------------|--------------|---------------------------------------------|----------------|
| Ballast     | 100W         | Universal input<br>(85~265V <sub>AC</sub> ) | 400V           |

### Features

- High efficiency (>90% at 85V<sub>AC</sub> input)
- Low Total Harmonic Distortion (THD) (<10% at 265V<sub>AC</sub> input, 25W load)

### Key Design Notes

- R1, R2, R5, C11 should be optimized for best THD characteristic.

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

| Datasheet Identification | Product Status         | Definition                                                                                                                                                                                               |
|--------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advance Information      | Formative or In Design | This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.                                                                       |
| Preliminary              | First Production       | This datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design. |
| No Identification Needed | Full Production        | This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.                                                   |
| Obsolete                 | Not In Production      | This datasheet contains specifications on a product that has been discontinued by Fairchild Semiconductor. The datasheet is printed for reference information only.                                      |
