

EProClock® PCI Express Gen 2 & Gen 3 Generator

Features

- Optimized 100 MHz Operating Frequencies to Meet the Next Generation PCI-Express Gen 2 & Gen 3
- Low power push-pull type differential output buffers
- Integrated voltage regulator
- Integrated resistors on differential clocks
- Four 100-MHz differential PCI-Express clocks
- Low jitter (<50ps)
- EProClock® Programmable Technology
- I²C support with readback capabilities
- Triangular Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 25MHz Crystal Input or Clock input
- Industrial Temperature -40°C to 85°C
- 3.3V Power supply
- 32-pin QFN package

32-QFN Pin Definitions

Pin No.	Name	Type	Description
1	VDD	PWR	3.3V Power Supply
2	VSS	GND	Ground
3	NC	NC	No Connect.
4	NC	NC	No Connect.
5	VDD	PWR	3.3V Power Supply
6	NC	NC	No Connect.
7	NC	NC	No Connect.
8	VSS	GND	Ground
9	VSS	GND	Ground
10	SRC0	O, DIF	100MHz True differential serial reference clock
11	SRC0#	O, DIF	100MHz Complement differential serial reference clock
12	VSS	GND	Ground
13	SRC1	O, DIF	100MHz True differential serial reference clock
14	SRC1#	O, DIF	100MHz Complement differential serial reference clock
15	VDD	PWR	3.3V Power Supply
16	NC	NC	No Connect.
17	VDD	PWR	3.3V Power Supply
18	VDD	PWR	3.3V Power Supply
19	SRC2#	O, DIF	100MHz Complement differential serial reference clock
20	SRC2	O, DIF	100MHz True differential serial reference clock
21	VSS	GND	Ground
22	SRC3#	O, DIF	100MHz Complement differential serial reference clock
23	SRC3	O, DIF	100MHz True differential serial reference clock
24	VDD	PWR	3.3V Power Supply
25	CKPWRGD/PD#	I	3.3V LVTTL input pin. When PD# is asserted low, the device will power down.
26	VSS	GND	Ground
27	XOUT	O, SE	25MHz Crystal output, <i>Float XOUT if using CLKIN (Clock Input)</i>
28	XIN/CLKIN	I	25MHz Crystal input or 3.3V, 25MHz Clock Input
29	VDD	PWR	3.3V Power Supply
30	NC	NC	No Connect.
31	SDATA	I/O	SMBus compatible SDATA
32	SCLK	I	SMBus compatible SCLOCK

EProClock® Programmable Technology

EProClock® is the world's first non-volatile programmable clock. The EProClock® technology allows board designer to promptly achieve optimum compliance and clock signal integrity; historically, attainable typically through device and/or board redesigns.

EProClock® technology can be configured through SMBus or hard coded.

Features:

- > 4000 bits of configurations
- Can be configured through SMBus or hard coded
- Custom frequency sets
- Differential skew control on true or compliment or both

- Differential duty cycle control on true or compliment or both
- Differential amplitude control
- Differential slew rate control
- Program different spread profiles and modulation rates

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers are individually enabled or disabled. The registers associated with the Serial Data Interface initialize to

their default setting at power-up. The use of this interface is optional. Clock device register changes are normally made at system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For

block write/read operation, access the bytes in sequential order from lowest to highest (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code described in *Table 1*.

The block write and block read protocol is outlined in *Table 2* while *Table 3* outlines byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

Table 1. Command Code Definition

Bit	Description
7	0 = Block read or block write operation, 1 = Byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'

Table 2. Block Read and Block Write Protocol

Block Write Protocol		Block Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
8:2	Slave address—7 bits	8:2	Slave address—7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code—8 bits	18:11	Command Code—8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Byte Count—8 bits	20	Repeat start
28	Acknowledge from slave	27:21	Slave address—7 bits
36:29	Data byte 1—8 bits	28	Read = 1
37	Acknowledge from slave	29	Acknowledge from slave
45:38	Data byte 2—8 bits	37:30	Byte Count from slave—8 bits
46	Acknowledge from slave	38	Acknowledge
....	Data Byte /Slave Acknowledges	46:39	Data byte 1 from slave—8 bits
....	Data Byte N—8 bits	47	Acknowledge
....	Acknowledge from slave	55:48	Data byte 2 from slave—8 bits
....	Stop	56	Acknowledge
			Data bytes from slave / Acknowledge
			Data Byte N from slave—8 bits
			NOT Acknowledge
			Stop

Table 3. Byte Read and Byte Write Protocol

Byte Write Protocol		Byte Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start

5	1	RESERVED	RESERVED

Bit	@Pup	Name	Description
4	0	OTP_4	OTP_ID Identification for programmed device
3	0	OTP_3	
2	1	OTP_2	
1	0	OTP_1	
0	1	OTP_0	

Table 4. Output Driver Status

	All Differential Clocks	
	Clock	Clock#
PD# = 0 (Power down)	Low	Low

PD# (Power down) Assertion

When PD is sampled HIGH by two consecutive rising edges of SRCC, differential clocks must held LOW. When PD mode is desired as the initial power on state, PD must be asserted HIGH in less than 10 μ s after asserting CKPWRGD.

PD# (Power down) Clarification

The CKPWRGD/PD# pin is a dual-function pin. During initial power up, the pin functions as CKPWRGD. Once CKPWRGD has been sampled HIGH by the clock chip, the pin assumes PD# functionality. The PD# pin is an asynchronous active LOW input used to shut off all clocks cleanly before shutting off power to the device. This signal is synchronized internally to the device before powering down the clock synthesizer. PD# is also an asynchronous input for powering up the system. When PD# is asserted LOW, clocks are driven to a LOW value and held before turning off the VCOs and the crystal oscillator.

PD# Deassertion

The power up latency is less than 1.8 ms. This is the time from the deassertion of the PD# pin or the ramping of the power supply until the time that stable clocks are generated from the clock chip. All differential outputs stopped in a three-state condition, resulting from power down are driven high in less than 300 μ s of PD# deassertion to a voltage greater than 200 mV. After the clock chip's internal PLL is powered up and locked, all outputs are enabled within a few clock cycles of each clock. Figure 2 is an example showing the relationship of clocks coming up.
