

Improved Low-Power, CMOS Analog Switches with Latches

General Description

Maxim's redesigned DG421/DG423/DG425 monolithic analog switches now feature guaranteed on-resistance matching (3Ω max) between switches and on-resistance flatness over the signal range (4Ω max). These low on-resistance switches (20Ω typ) conduct equally well in both directions. They guarantee a low charge injection of 15pC maximum and an ESD tolerance of 2000V minimum per Method 3015.7. Off leakage current over temperature has also been reduced (less than 5nA at $+85^\circ\text{C}$).

The DG421/DG423/DG425 are precision, dual CMOS switches with latchable logic inputs that simplify interfacing with microprocessors (μPs). The single-pole/single-throw DG421 and double-pole/single-throw DG425 are normally open dual switches. The dual, single-pole/double-throw DG423 has two normally open and two normally closed switches. Fast switching times (175ns for t_{ON} and 145ns for t_{OFF}) and low power consumption ($35\mu\text{W}$ max) make these parts ideal for battery-powered applications requiring μP -compatible switches. Operation is from a single $+10\text{V}$ to $+30\text{V}$ supply, or bipolar $\pm 4.5\text{V}$ to $\pm 20\text{V}$ supplies. Fabricated with the same 44V silicon-gate process, these switches have rail-to-rail signal handling capabilities.

Applications

Sample-and-Hold Circuits	Modems
Fax Machines	Test Equipment
Battery-Operated Systems	PBX, PABX
Guidance and Control Systems	Military Radios
Audio Signal Routing	Communication Systems

Functional Diagrams/Truth Tables

New Features

- ♦ Plug-In Upgrades for Industry-Standard DG421/DG423/DG425
- ♦ Improved $r_{\text{DS(ON)}}$ Match Between Channels (3Ω max)
- ♦ Guaranteed $r_{\text{FLAT(ON)}}$ Over Signal Range (4Ω max)
- ♦ Improved Charge Injection (15pC max)
- ♦ Improved Off Leakage Current Over Temperature ($<5\text{nA}$ at $+85^\circ\text{C}$)
- ♦ Withstands Electrostatic Discharge (2000V min) per Method 3015.7

Existing Features

- ♦ Low $r_{\text{DS(ON)}}$ (35Ω max)
- ♦ Single-Supply Operation $+10\text{V}$ to $+30\text{V}$
Bipolar-Supply Operation $\pm 4.5\text{V}$ to $\pm 20\text{V}$
- ♦ Low Power Consumption ($35\mu\text{W}$ max)
- ♦ Rail-to-Rail Signal Handling Capability
- ♦ TTL/CMOS-Logic Compatible

Improved Low-Power, CMOS Analog Switches with Latches

ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to V-

V+	44V
GND	25V
V _L	(GND - 0.3V) to (V+ + 0.3V)
Digital Inputs, V _S , V _D (Note 1)	(V- - 2V) to (V+ + 2V)
Current (any terminal, except S or D)	30mA
Continuous Current, S or D	20mA
Peak Current, S or D (pulsed at 1ms, 10% duty cycle max)	100mA

Continuous Power Dissipation (T_A = +70°C)

16-Pin Plastic DIP (derate 10.53mW/°C above +70°C)	842mW
20-Pin PLCC (derate 10.00mW/°C above +70°C)	800mW
16-Pin CERDIP (derate 10.00mW/°C above +70°C)	800mW

Operating Temperature Ranges

DG42_C	0°C to +70°C
DG42_D	-40°C to +85°C
DG42_A	-55°C to +125°C

Storage Temperature Ranges

DG42_C/DG42_D	-65°C to +125°C
DG42_A	-65°C to +150°C
Lead Temperature (soldering, 10sec)	+300°C

Note 1: Signals on S, D, or IN exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: Typical values are for design aid only, are not guaranteed, and are not subject to production testing. The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: On-resistance match between channels and flatness are guaranteed only with bipolar-supply operation. Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured at the extremes of the specified analog signal range.

Note 5: Leakage parameters IS(OFF), ID(OFF), and ID(ON) are 100% tested at the maximum rated hot temperature and guaranteed by correlation at +25°C.

Note 6: Off-Isolation Rejection Ratio = 20log (VD/VS), VD = output, VS = input to off switch.

Note 7: Between any two switches.

Applications Information

Operation with Supply Voltages Other Than $\pm 15V$

The DG421/DG423/DG425 switches operate with $\pm 4.5V$ to $\pm 20V$ bipolar supplies or with a $+10V$ to $+30V$ single supply. In either case, analog signals ranging from $V+$ to $V-$ can be switched. The *Typical Operating Characteristics* graphs illustrate typical analog-signal and supply-voltage on-resistance variations. The usual on-resistance temperature coefficient is $0.5\%/^{\circ}C$ (typ).

Logic Inputs

These devices operate with a single positive supply or with bipolar supplies. They maintain TTL compatibility with supplies anywhere in the $\pm 4.5V$ to $\pm 20V$ range as long as $V_L = +5V$. If V_L is connected to $V+$ or another supply at voltages other than $+5V$, the devices will operate at CMOS-logic-level inputs.

Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the devices. Always sequence $V+$ on first, followed by V_L , $V-$, and logic inputs. If power-supply sequencing is not possible, add two small, external signal diodes in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to $1V$ below $V+$ and $1V$ above $V-$, without affecting low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between $V+$ and $V-$ should not exceed $+44V$.
