Features

- Fast Read Access Time 45 ns
- Low-Power CMOS Operation
 - 100 µA Max Standby
 - 25 mA Max Active at 5 MHz
- JEDEC Standard Packages
 - 32-lead PDIP
 - 32-lead PLCC
 - 32-lead TSOP
- 5V ± 10% Supply
- . High Reliability CMOS Technology
 - 2000V ESD Protection
 - 200 mA Latchup Immunity
- Rapid Programming Algorithm 100 μs/Byte (Typical)
- CMOS and TTL Compatible Inputs and Outputs
- Integrated Product Identification Code
- Industrial Temperature Range
- Green (Pb/Halide-free) Packaging Option

1. Description

The AT27C010 is a low-power, high-performance 1,048,576-bit one-time programmable read-only memory (OTP EPROM) organized as 128K by 8 bits. They require only one 5V power supply in normal read mode operation. Any byte can be accessed in less than 45 ns, eliminating the need for speed reducing WAIT states on high-performance microprocessor systems.

In read mode, the AT27C010 typically consumes only 8 mA. Standby mode supply current is typically less than 10 μ A.

The AT27C010 is available in a choice of industry-standard JEDEC-approved one-time programmable (OTP) plastic PDIP, PLCC, and TSOP packages. All devices feature two line control ($\overline{\text{CE}}$, $\overline{\text{OE}}$) to give designers the flexibility to prevent bus contention.

With 128K byte storage capability, the AT27C010 allows firmware to be stored reliably and to be accessed by the system without the delays of mass storage media.

Atmel's AT27C010 has additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 µs/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry-standard programming equipment to select the proper programming algorithms and voltages.

3. System Considerations

Switching between active and standby conditions via the Chip Enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed datasheet limits, resulting in device non-conformance. At a minimum, a 0.1 μF high frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the V_{CC} and Ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 μF bulk electrolytic capacitor should be utilized, again connected between the V_{CC} and Ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

5. Absolute Maximum Ratings*

Temperature Under Bias	55°C to +125°C
Storage Temperature	65°C to +150°C
Voltage on Any Pin with Respect to Ground	2.0V to +7.0V ⁽¹⁾
Voltage on A9 with Respect to Ground	2.0V to +14.0V ⁽¹⁾
V _{PP} Supply Voltage with Respect to Ground	2.0V to +14.0V ⁽¹⁾

*NOTICE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V DC which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is V_{CC} + 0.75V DC which may overshoot to +7.0 volts for pulses of less than 20 ns.

6. Operating Modes

Note:

- 1. X can be V_{IL} or V_{IH}.
- 2. Refer to Programming Characteristics.
- 3. $V_H = 12.0 \pm 0.5V$.
- 4. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

Note:

- 1. V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP}
- 2. V_{PP} may be connected directly to V_{CC} , except during programming. The supply current would then be the sum of I_{CC} and I_{PP}

Notes: 1. Timing measurement reference level is 1.5V for -45 devices. Input AC drive levels are $V_{IL} = 0.0V$ and $V_{IH} = 3.0V$. Timing measurement reference levels for all other speed grades are $V_{OL} = 0.8V$ and $V_{OH} = 2.0V$. Input AC drive levels are $V_{IL} = 0.45V$ and $V_{IH} = 2.4V$.

- 2. $\overline{\text{OE}}$ may be delayed up to t_{CE} t_{OE} after the falling edge of $\overline{\text{CE}}$ without impact on t_{CE} .
- 3. \overline{OE} may be delayed up to t_{ACC} t_{OE} after the address is valid without impact on t_{ACC} .

^{3.} Program Pulse width tolerance is 100 μ sec \pm 5%.

18. Rapid Programming Algorithm

A 100 μ s \overline{PGM} pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5V and V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μ s \overline{PGM} pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 μ s pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0V and V_{CC} to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.

20. Package Information

20.1 32J - PLCC

Notes:

- 1. This package conforms to JEDEC reference MS-016, Variation AE.
- Dimensions D1 and E1 do not include mold protrusion.
 Allowable protrusion is .010"(0.254 mm) per side. Dimension D1 and E1 include mold mismatch and are measured at the extreme material condition at the upper or lower parting line.
- 3. Lead coplanarity is 0.004" (0.102 mm) maximum.
