

MAXIM

Dual Monolithic SPST CMOS Analog Switch

DG200A

General Description

The DG200A is a dual, normally closed, single-pole-single-throw (SPST) analog switch. This CMOS switch can be operated with power supplies ranging from $\pm 4.5\text{V}$ to $\pm 18\text{V}$. The DG200A has guaranteed break-before-make switching. Its maximum turn-off time is 500ns, and its maximum turn-on time is 100ns.

Maxim guarantees that the DG200A will not latch-up if the power supplies are turned off with input signals still connected as long as absolute maximum ratings are not violated.

Compared to the original manufacturer's product, Maxim's DG200A consumes significantly lower power, making it better suited for portable applications.

Applications

Winchester Disk Drives
Test Equipment
Communications Systems
PBX, PABX
Guidance and Control Systems
Head up Displays
Military Radios

Typical Operating Circuit

Features

- ◆ Improved 2nd Source! Power Supply Current $< 300\mu\text{A}$
- ◆ Wide Supply Range $\pm 4.5\text{V}$ to $\pm 18\text{V}$
- ◆ Single Supply Operation
- ◆ Non-Latching with Supplies Turned-off and Input Signals Present
- ◆ CMOS and TTL Logic Compatible
- ◆ Monolithic, Low Power CMOS Design

14 Pin Plastic DIP****	470mW

* All leads soldered or welded to PC board.

** Derate 6mW/°C above 75°C.

*** Derate 11mW/°C above 75°C.

**** Derate 6.5mW/°C above 25°C.

Stresses listed under "Absolute Maximum Ratings" may be applied (one at a time) to devices without resulting in permanent damage. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: Signals on S_X , D_X , or IN_X , exceeding V^- or V^+ will be clamped by internal diodes. LIMIT FORWARD DIODE CURRENT to maximum current ratings.

Note 2: The algebraic convention whereby the most negative value is a minimum, and the most positive is a maximum, is used in this data sheet.

Note 3: Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.

Note 4: $I_{D(on)}$ is leakage from driver into "ON" switch.

Note 5: "OFF" isolation = $20 \log V_S/V_D$, V_S = input to OFF switch, V_D = output.
