

## High-Speed Differential Line Receivers

### Features

- Sixteen line receivers meet or exceed the requirements of the ANSI/TIA/EIA-644-1995 Standard
- Designed for signaling rates up to 660 Mbps
- 0V to 3V common-mode input voltage range
- Operates from a single 3.3V supply
- Typical propagation delay time: 2.6ns
- Output skew 100ps (typical)
- Part-to-part skew is less than 1ns
- Integrated 110-Ohm termination on PI90LVT386
- Low Voltage TTL (LVTTL) levels are 5V tolerant
- Open-circuit fail safe
- Flow-through pin out
- Packaging (Pb-free & Green available):
  - 64-Pin Thin Shrink Small Output TSSOP (A)

### Description

The PI90LVx386 family consists of sixteen differential line receivers with 3-state outputs that implement Low-Voltage Differential Signaling (LVDS). Any of the differential receivers will provide a valid logical output state with a  $\pm 100\text{mV}$  differential input voltage within the input common-mode voltage range that allows 0 to 3V of ground potential difference between two LVDS nodes. The independent EN pins can be used to place the outputs in either a normal logic state (high or low logic levels) or a high-impedance state. In high-impedance state, outputs neither load nor drive the bus lines.

The intended application of these devices, and their signaling techniques, is for point-to-point baseband data transmission over controlled impedance media of approximately 100-ohms with a 100-Ohm termination resistor. The PI90LVT386 integrates the terminating resistors while the PI90LV386 requires external resistors. The transmission media may be printed circuit board traces, backplanes, or cables. The PI90LV386's 16 receivers integrated into the same substrate allow precise timing alignment.

These parts are characterized for operation from  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .

**Notes:**

1. All typical values are at 25°C and with a 3.3V supply
2. t<sub>sk(o)</sub> is the magnitude of the time difference between the t<sub>PLH</sub> or t<sub>PHL</sub> of all drivers of a single device with all of their inputs connected together.
3. t<sub>sk(pp)</sub> is the magnitude of the difference in propagation delay times between any specified terminals of two devices when both devices operate with the same supply voltages, at the same temperature, and have identical packages and test circuits.
4. ROUT0 disable time is 1 nanosecond greater.
