TPS650864 Configurable Multirail PMU for Xilinx® MPSoCs and FPGAs

1 Features

- Wide V_{IN} range from 5.6V to 21V
- Three variable-output voltage synchronous step-down controllers with D-CAP2™ Topology
  - Scalable output current using external fets with selectable current limit
  - I^2C DVS control from 0.41V to 1.67V in 10mV steps or 1V to 3.575V in 25mV steps
- Three variable-output voltage synchronous step-down converters with dcs-control topology
  - V_{IN} range from 3V to 5.5V
  - Up to 3 A of output current
  - I^2C DVS control from 0.41V to 1.67V in 10mV steps or 0.425V to 3.575V in 25mV steps
- Three LDO regulators with adjustable output voltage
  - LDOA1: I^2C-selectable voltage from 1.35V to 3.3V for up to 200mA of output current
  - LDOA2 and LDOA3: I^2C-selectable voltage from 0.7V to 1.5V for up to 600mA of output current each
- VTT LDO for DDR memory termination
- Three load switches with slew rate control
  - Up to 300mA of output current with voltage drop less than 1.5% of nominal input voltage
  - R_{DSON} < 96mΩ at input voltage of 1.8V
- 5V fixed-output voltage LDO (LDO5)
  - Power supply for gate drivers of SMPS and for LDOA1
  - Automatic switch to external 5V buck for higher efficiency
- Built-in flexibility and configurability by factory OTP programming
  - Six GPI pins configurable to enable (CTL1 to CTL6) or sleep mode entry (CTL3 and CTL6) of any selected rails
  - Four GPO pins configurable to power good of any selected rails
  - Open-drain interrupt output pin
- I^2C interface supports standard mode (100kHz), fast mode (400kHz), and fast mode plus (1MHz)

2 Applications

- Programmable logic controller
- Machine vision camera
- Video surveillance
- Test and measurement
- Embedded PCs
- Motion control
- Portable ultrasound

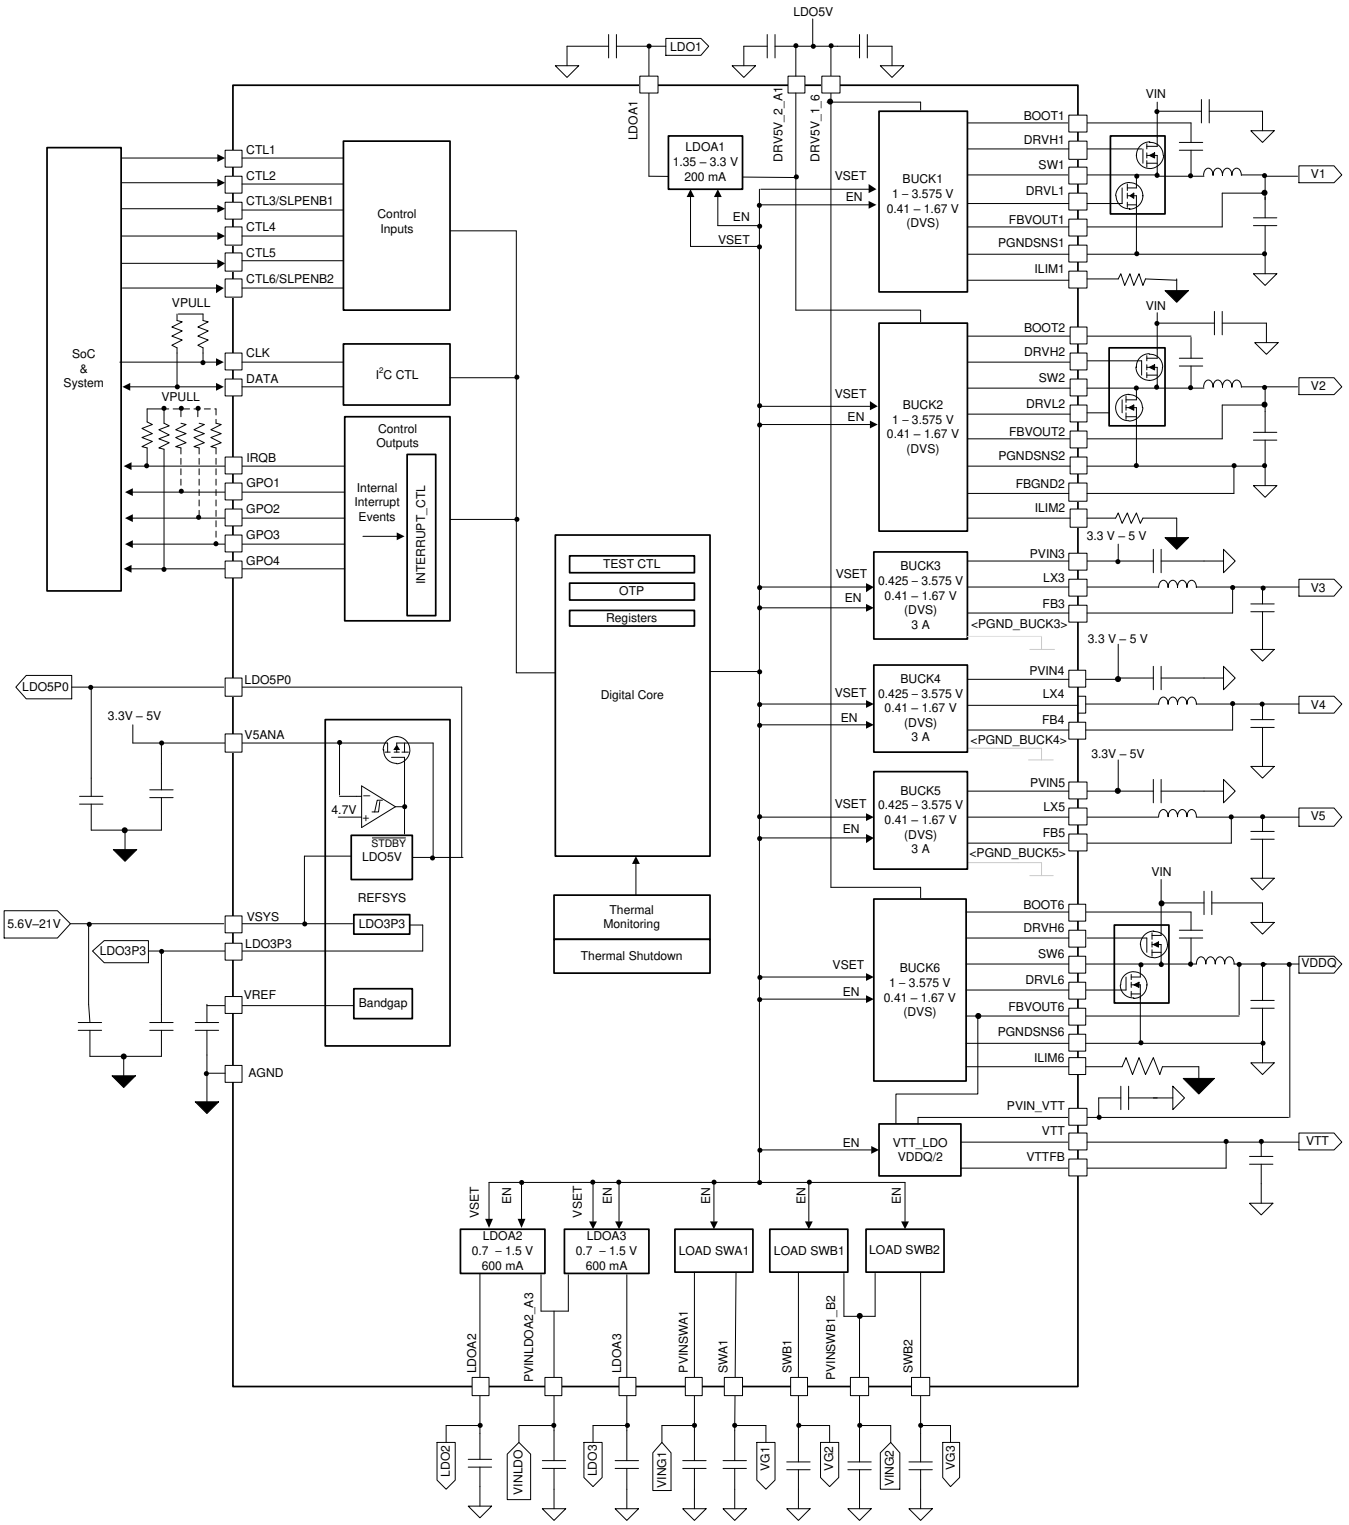
3 Description

The TPS650864 device family is a single-chip power-management IC (PMIC) designed for Xilinx Zynq® multiprocessor system-on-chip (MPSoCs) and field programmable gate array (FPGA) families. The TPS650864 offers an input range of 5.6V to 21V, enabling a wide range of applications (see the *Device Comparison Table*). The device is targeted for wall-powered applications or 2S, 3S, or 4S Li-Ion battery packs (NVDC or non-NVDC power architectures). See the *Typical Application* section for 5V input supplies. The D-CAP2 and DCS-Control high-frequency voltage regulators use small passives to achieve a small solution size. The D-CAP2 and DCS-Control topologies have excellent transient response performance, ideal for processor core and system memory rails that have fast load switching. An I^2C interface allows simple control either by an embedded controller (EC) or by an SoC. The PMIC comes in an 8mm × 8mm, single-row VQFN package with thermal pad for good thermal dissipation.

Device Information

PART NUMBER	PACKAGE(1)	BODY SIZE (NOM)
TPS650864 (2)	VQFN (64)	8.00mm × 8.00mm

(1) For more information, see the *Mechanical, Packaging, and Orderable Information* section.
(2) For device options, see the *Device Comparison Table*.



PMIC Functional Block Diagram

Table of Contents

4 Device Comparison Table

Table 4-1 lists a brief summary of the default values for each part number stored in one-time programmable (OTP) memory. A full summary of each part number can be found in the applications section linked in the *SECTION* column. The step size is indicated by the values in parenthesis. If alternate voltages are available through pin-strapping, they are separated with a comma.

Table 4-1. Default Values

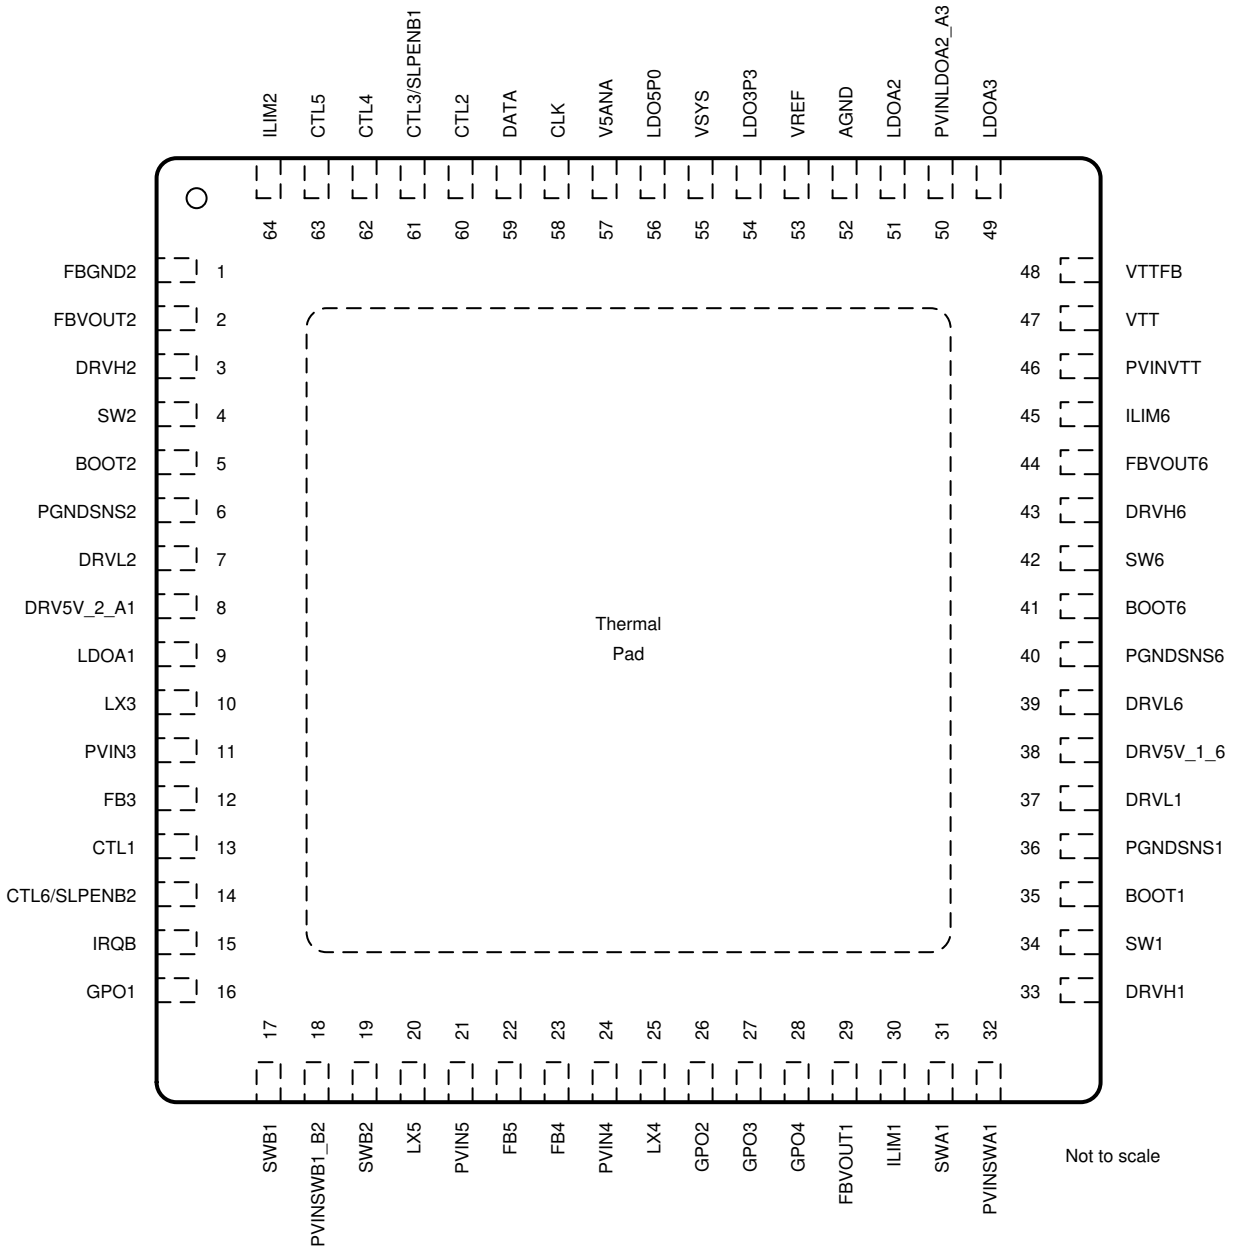
(1) Indicates the original intent of the part number. Parts can be used for alternate applications.

5 Pin Configuration and Functions

Figure 5-1 shows the 64-pin RSK Plastic Quad Flatpack No-Lead package.



The thermal pad must be connected to the system power ground plane.

Figure 5-1. 64-Pin RSK VQFN With Exposed Thermal Pad (Top View)

Table 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
SMPS REGULATORS			
1	FBGND2	I	Remote negative feedback sense for BUCK2 controller. Connect to negative terminal of output capacitor. Connect to ground when not in use.
2	FBVOUT2	I	Remote positive feedback sense for BUCK2 controller. Connect to positive terminal of output capacitor. Connect to ground when not in use.
3	DRVH2	O	High-side gate driver output for BUCK2 controller. Leave floating when not in use.
4	SW2	I	Switch node connection for BUCK2 controller. Connect to ground when not in use.
5	BOOT2	I	Bootstrap pin for BUCK2 controller. Connect a 100nF ceramic capacitor between this pin and SW2 pin. Leave floating when not in use.
6	PGNDSNS2	I	Power GND connection for BUCK2. Connect to ground terminal of external low-side FET. Connect to ground when not in use.
7	DRVL2	O	Low-side gate driver output for BUCK2 controller. Leave floating when not in use.
8	DRV5V_2_A1	I	5V supply to BUCK2 gate driver and LDOA1. Bypass to ground with a 2.2µF (typical) ceramic capacitor. Shorted on board to LDO5P0 pin typically. Bypass not required if BUCK2 and LDOA1 are not in use.
10	LX3	O	Switch node connection for BUCK3 converter. Leave floating when not in use.
11	PVIN3	I	Power input to BUCK3 converter. Bypass to ground with a 10µF (typical) ceramic capacitor. Bypass not required if BUCK3 is not in use.
12	FB3	I	Remote feedback sense for BUCK3 converter. Connect to positive terminal of output capacitor. Connect to ground when not in use.
20	LX5	O	Switch node connection for BUCK5 converter. Leave floating when not in use.
21	PVIN5	I	Power input to BUCK5 converter. Bypass to ground with a 10µF (typical) ceramic capacitor. Bypass not required if BUCK5 is not in use.
22	FB5	I	Remote feedback sense for BUCK5 converter. Connect to positive terminal of output capacitor. Connect to ground when not in use.
23	FB4	I	Remote feedback sense for BUCK4 converter. Connect to positive terminal of output capacitor. Connect to ground when not in use.
24	PVIN4	I	Power input to BUCK4 converter. Bypass to ground with a 10µF (typical) ceramic capacitor. Bypass not required if BUCK4 is not in use.
25	LX4	O	Switch node connection for BUCK4 converter. Leave floating when not in use.
29	FBVOUT1	I	Remote feedback sense for BUCK1 controller. Connect to positive terminal of output capacitor. Connect to ground when not in use.
30	ILIM1	I	Current limit set pin for BUCK1 controller. Fit a resistor from this pin to ground to set current limit of external low-side FET. Connect to ground when BUCK1 not in use.
33	DRVH1	O	High-side gate driver output for BUCK1 controller. Leave floating when not in use.
34	SW1	I	Switch node connection for BUCK1 controller. Connect to ground when not in use.
35	BOOT1	I	Bootstrap pin for BUCK1 controller. Connect a 100nF ceramic capacitor between this pin and SW1 pin. Leave floating when not in use.
36	PGNDSNS1	I	Power GND connection for BUCK1. Connect to ground terminal of external low-side FET. Connect to ground when not in use.
37	DRVL1	O	Low-side gate driver output for BUCK1 controller. Leave floating when not in use.
38	DRV5V_1_6	I	5V supply to BUCK1 and BUCK6 gate drivers. Bypass to ground with a 2.2µF (typical) ceramic capacitor. Shorted on board to LDO5P0 pin typically. Bypass not required if BUCK1 and BUCK6 are not in use.
39	DRVL6	O	Low-side gate driver output for BUCK6 controller. Leave floating when not in use.
40	PGNDSNS6	I	Power GND connection for BUCK6. Connect to ground terminal of external low-side FET. Connect to ground when not in use.
41	BOOT6	I	Bootstrap pin for BUCK6 controller. Connect a 100nF ceramic capacitor between this pin and SW6 pin. Leave floating when not in use.
42	SW6	I	Switch node connection for BUCK6 controller. Connect to ground when not in use.
43	DRVH6	O	High-side gate driver output for BUCK6 controller. Leave floating when not in use.
44	FBVOUT6	I	Remote feedback sense for BUCK6 controller and reference voltage for VTT LDO regulation. Connect to positive terminal of output capacitor. Connect to ground when not in use.
45	ILIM6	I	Current limit set pin for BUCK6 controller. Fit a resistor from this pin to ground to set current limit of external low-side FET. Connect to ground when BUCK6 not in use.
64	ILIM2	I	Current limit set pin for BUCK2 controller. Fit a resistor from this pin to ground to set current limit of external low-side FET. Connect to ground when BUCK2 not in use.
LDO AND LOAD SWITCHES			

Table 5-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
9	LDOA1	O	LDOA1 output. Bypass to ground with a 4.7µF (typical) ceramic capacitor. Leave floating when not in use.
17	SWB1	O	Output of load switch B1. Bypass to ground with a 0.1µF (typical) ceramic capacitor. Leave floating when not in use.
18	PVINSWB1_B2	I	Power supply to load switch B1 and B2. Bypass to ground with a 1µF (typical) ceramic capacitor to improve transient performance. Connect to ground when not in use.
19	SWB2	O	Output of load switch B2. Bypass to ground with a 0.1µF (typical) ceramic capacitor. Leave floating when not in use.
31	SWA1	O	Output of load switch A1. Bypass to ground with a 0.1µF (typical) ceramic capacitor. Leave floating when not in use.
32	PVINSWA1	I	Power supply to load switch A1. Bypass to ground with a 1µF (typical) ceramic capacitor to improve transient performance. Connect to ground when not in use.
46	PVINVTT	I	Power supply to VTT LDO. Bypass to ground with a 10µF (minimum) ceramic capacitor. Bypass not required if VTT LDO is not in use.
47	VTT	O	Output of load VTT LDO. Bypass to ground with 2× 22µF (minimum) ceramic capacitors. Leave floating when not in use.
48	VTTFB	I	Remote feedback sense for VTT LDO. Connect to positive terminal of output capacitor. Connect to ground when not in use.
49	LDOA3	O	Output of LDOA3. Bypass to ground with a 4.7µF (typical) ceramic capacitor. Leave floating when not in use.
50	PVINLDOA2_A3	I	Power supply to LDOA2 and LDOA3. Bypass to ground with a 4.7µF (typical) ceramic capacitor. Connect to ground when not in use.
51	LDOA2	O	Output of LDOA2. Bypass to ground with a 4.7µF (typical) ceramic capacitor. Leave floating when not in use.
54	LDO3P3	O	Output of 3.3V internal LDO. Bypass to ground with a 4.7µF (typical) ceramic capacitor.
56	LDO5P0	O	Output of 5V internal LDO or an internal switch that connects this pin to V5ANA. Bypass to ground with a 4.7µF (typical) ceramic capacitor.
57	V5ANA	I	Bias used by converters (BUCK3, BUCK4, and BUCK5) for regulation. Must be same supply as PVINx. Also has an internal load switch that connects this pin to LDO5P0 pin if 5V is used. Bypass this pin with an optional ceramic capacitor to improve transient performance.
INTERFACE			
13	CTL1	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
14	CTL6/SLPENB2	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin. Alternatively, when configured to active-low sleep enable, a group of VRs chosen can be entered into (L) or out of (H) sleep state where their output voltages may be different from those in normal state.
15	IRQB	O	Open-drain output interrupt pin. Refer to Section 7.13.4, *IRQ: PMIC Interrupt Register*, for definitions.
16	GPO1	O	General purpose output that can be configured to either open-drain or push-pull arrangement. Regardless of the configuration, the pin can be programmed either to reflect Power Good status of VRs of any choice or to be controlled by an I^2C register bit by the user, which then can be used as an enable signal to an external VR.
26	GPO2	O	General purpose output that can be configured to either open-drain or push-pull arrangement. Regardless of the configuration, the pin can be programmed either to reflect Power Good status of VRs of any choice or to be controlled by an I^2C register bit by the user, which then can be used as an enable signal to an external VR.
27	GPO3	O	General purpose output that can be configured to either open-drain or push-pull arrangement. Regardless of the configuration, the pin can be programmed either to reflect Power Good status of VRs of any choice or to be controlled by an I^2C register bit by the user, which then can be used as an enable signal to an external VR.
28	GPO4	O	Open-drain output that can be configured to reflect Power Good status of VRs of any choice or to be controlled by an I^2C register bit by the user, which then can be used as an enable signal to an external VR.
58	CLK	I	I^2C clock
59	DATA	I/O	I^2C data
60	CTL2	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
61	CTL3/SLPENB1	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin. Alternatively, when configured to active-low sleep enable, a group of VRs chosen can be entered into (L) or out of (H) sleep state where their output voltages may be different from those in normal state.
62	CTL4	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
63	CTL5	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
REFERENCE			
52	AGND	—	Analog ground. Do not connect to the thermal pad ground on top layer. Connect to ground of VREF capacitor.
53	VREF	O	Band-gap reference output. Stabilize it by connecting a 100nF (typical) ceramic capacitor between this pin and quiet ground.

Table 5-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
55	VSYS	I	System voltage detection and input to internal LDOs (3.3V and 5V). Bypass to ground with a 1µF (typical) ceramic capacitor.
THERMAL PAD			
—	Thermal pad (PGND)	—	Connect to PCB ground plane using multiple vias for good thermal and electrical performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
ANALOG			
Input voltage from battery, VSYS	–0.3	28	V
PVIN3, PVIN4, PVIN5, LDO5P0, DRV5V_1_6, DRV5V_2_A1, DRVL1, DRVL2, DRVL6	–0.3	7	V
V5ANA	–0.3	6	V
PGNDSNS1, PGNDSNS2, PGNDSNS6, AGND, FBGND2	–0.3	0.3	V
DRVH1, DRVH2, DRVH6, BOOT1, BOOT2, BOOT6	–0.3	34	V
SW1, SW2, SW6	–5(2)	28	V
LX3, LX4, LX5	–2(3)	8	V
Differential voltage, BOOTx to SWx	–0.3	5.5	V
VREF, LDO3P3, FBVOUT1, FBVOUT2, FBVOUT6, FB3, FB4, FB5, ILIM1, ILIM2, ILIM6, PVINVTT, VTT, VTTFB, PVINSWA1, SWA1, PVINSWB1_B2, SWB1, SWB2, LDOA1	–0.3	3.6	V
PVINLDOA2_A3, LDOA2, LDOA3	–0.3	3.3	V
DIGITAL IO			
DATA, CLK, GPO1-GPO3	–0.3	3.6	V
CTL1-CTL6, GPO4, IRQB	–0.3	7	V
Storage temperature, T_{stg}	–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Transient for less than 5ns
(3) Transient for less than 20ns

6.2 ESD Ratings

			VALUE	UNIT
V_{ESD}	Electrostatic discharge	Human Body Model (HBM), per ANSI/ESDA/JEDEC JS001(1)	±1000	V
		Charged Device Model (CDM), per JESD22-C101(2)	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT

6.4 Thermal Information

THERMAL METRIC[1]		TPS650864 RSK (VQFN) 64 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	25.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	11.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	4.4	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	4.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.7	°C/W

(1) For more information about traditional and new thermal metrics, see *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics: Total Current Consumption

over recommended free-air temperature range and over recommended input voltage range (typical values are at T_A = 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{SD}	PMIC shutdown current that includes I_Q for references, LDO5, LDO3P3, and digital core	V_{SYS} = 13V, all functional output rails are disabled		65		µA

6.6 Electrical Characteristics: Reference and Monitoring System

over recommended free-air temperature range and over recommended input voltage range (typical values are at T_A = 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
REFERENCE						
V_{REF}	Band-gap reference voltage			1.25		V
	Accuracy		–0.5%		0.5%	
C_{VREF}	Band-gap output capacitor		0.047	0.1	0.22	µF
$V_{SYS\_UVLO\_5V}$	VSYS UVLO threshold for LDO5	V_{SYS} falling	5.24	5.4	5.56	V
$V_{SYS\_UVLO\_5V\_HYS}$	VSYS UVLO threshold hysteresis for LDO5	V_{SYS} rising above $V_{SYS\_UVLO\_5V}$		200		mV
$V_{SYS\_UVLO\_3V}$	VSYS UVLO threshold for LDO3P3	V_{SYS} falling	3.45	3.6	3.75	V
$V_{SYS\_UVLO\_3V\_HYS}$	VSYS UVLO threshold hysteresis for LDO3P3	V_{SYS} rising above $V_{SYS\_UVLO\_3V}$		150		mV
T_{CRIT}	Critical threshold of die temperature	T_J rising	130	145	160	°C
T_{CRIT_HYS}	Hysteresis of T_{CRIT}	T_J falling		10		°C
T_{HOT}	Hot threshold of die temperature	T_J rising	110	115	120	°C
T_{HOT_HYS}	Hysteresis of T_{HOT}	T_J falling		10		°C
LDO5						
V_{IN}	Input voltage at V_{SYS} pin		5.6	13	21	V
V_{OUT}	DC output voltage	I_{OUT} = 10mA	4.9	5	5.1	V
I_{OUT}	DC output current			100	180	mA
I_{OCP}	Overcurrent protection	Measured with output shorted to ground	200			mA
V_{TH_PG}	Power Good assertion threshold in percentage of target V_{OUT}	V_{OUT} rising		94%		
$V_{TH\_PG\_HYS}$	Power Good deassertion hysteresis	V_{OUT} rising or falling		4%		
I_Q	Quiescent current	V_{IN} = 13V, I_{OUT} = 0A		20		µA
C_{OUT}	External output capacitance		2.7	4.7	10	µF
V5ANA-to-LDO5P0 LOAD SWITCH						
R_{DSON}	On resistance	V_{IN} = 5V, measured from V5ANA pin to LDO5P0 pin at I_{OUT} = 200mA			1	Ω
V_{TH_PG}	Power Good threshold for external 5-V supply	V_{V5ANA} rising		4.7		V
$V_{TH\_HYS\_PG}$	Power Good threshold hysteresis for external 5-V supply	V_{V5ANA} falling		100		mV
I_{LKG}	Leakage current	Switch disabled, V_{V5ANA} = 5 V, V_{LDO5} = 0 V			10	µA
LDO3P3						
V_{IN}	Input voltage at V_{SYS} pin		5.6	13	21	V
V_{OUT}	DC output voltage	I_{OUT} = 10mA		3.3		V
	Accuracy	V_{IN} = 13V, I_{OUT} = 10mA	–3%		3%	
I_{OUT}	DC output current				40	mA
I_{OCP}	Overcurrent protection	Measured with output shorted to ground	70			mA
V_{TH_PG}	Power Good assertion threshold in percentage of target V_{OUT}	V_{OUT} rising		92%		
$V_{TH\_PG\_HYS}$	Power Good deassertion hysteresis	V_{OUT} falling		3%		

6.6 Electrical Characteristics: Reference and Monitoring System (continued)

over recommended free-air temperature range and over recommended input voltage range (typical values are at T_A = 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_Q	Quiescent current	V_{IN} = 13V, I_{OUT} = 0A		20		µA
C_{OUT}	External output capacitance		2.2	4.7	10	µF

6.7 Electrical Characteristics: Buck Controllers

over recommended input voltage range, T_A = –40°C to +85°C and T_A = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
BUCK1, BUCK2, BUCK6						
V_{IN}	Power input voltage for external HSD FET		5.6	13	21	V
V_{OUT}	DC output voltage VID range and options	VID step size = 10mV, BUCKx_VID[6:0] progresses from 0000001 to 1111111	0.41	See Section 4	1.67	V
		VID step size = 25mV, BUCKx_VID[6:0] progresses from 0000001 to 1111111	1(1)	See Section 4	3.575	V
	DC output voltage accuracy	V_{OUT} = 1, 1.2, 1.35, 1.5, 1.8, 2.5, 3.3V, I_{OUT} = 100mA to 7A	–2%		2%	
	Total output voltage accuracy (DC + ripple) in DCM	I_{OUT} = 10mA, V_{OUT} ≤ 1V	–30		40	mV
$V_{FB\_EXT\_BUCK1}$	Feedback regulation voltage	Applies only to the Buck1 Controller if programmed for external feedback voltage adjustability	384	400	416	mV
$I_{FB\_LKG\_BUCK1}$	Feedback pin leakage current	Applies only to the Buck1 Controller if programmed for external feedback voltage adjustability			65	nA
$SR(V_{OUT})$	Output DVS slew rate	VID step size = 10mV	2.5	3.125		mV/µs
		VID step size = 25mV	3.125	4		
I_{LIM_LSD}	Low-side output valley current limit accuracy (programmed by external resistor R_{LIM})		–15%		15%	
I_{LIMREF}	Source current out of ILIM1 pin	T = 25°C	45	50	55	µA
V_{LIM}	Voltage at ILIM1 pin	$V_{LIM} = R_{LIM} \times I_{LIMREF}$	0.2		2.25	V
$\Delta V_{OUT}/\Delta V_{IN}$	Line regulation	V_{OUT} = 1, 1.2, 1.35, 1.5, 1.8, 2.5, 3.3V, I_{OUT} = 7A	–0.5%		0.5%	
$\Delta V_{OUT}/\Delta I_{OUT}$	Load regulation	V_{IN} = 13V, V_{OUT} = 1, 1.2, 1.35, 1.5, 1.8, 2.5, 3.3V, I_{OUT} = 0A to 7A, referenced to V_{OUT} at $I_{OUT} = I_{OUT\_MAX}$	0%		1%	
V_{TH_PG}	Power Good deassertion threshold in percentage of target V_{OUT}	V_{OUT} rising	105.5%	108%	110.5%	
		V_{OUT} falling	89.5%	92%	94.5%	
R_{DSON_DRVH}	Driver DRVH resistance	Source, IDRVH = –50mA		3		Ω
		Sink, IDRVH = 50mA		2		Ω
R_{DSON_DRVL}	Driver DRVL resistance	Source, IDRVL = –50mA		3		Ω
		Sink, IDRVL = 50mA		0.4		Ω
R_{DIS}	Output auto-discharge resistance	BUCKx_DISCHG[1:0] = 01		100		Ω
		BUCKx_DISCHG[1:0] = 10		200		Ω
		BUCKx_DISCHG[1:0] = 11		500		Ω

6.7 Electrical Characteristics: Buck Controllers (continued)

over recommended input voltage range, T_A = –40°C to +85°C and T_A = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C_{BOOT}	Bootstrap capacitance			100		nF
R_{ON_BOOT}	Bootstrap switch ON resistance				20	Ω

(1) BUCKx_VID[6:0] = 0000001 – 0011000

6.8 Electrical Characteristics: Synchronous Buck Converters

over recommended input voltage range, T_A = –40°C to +85°C and T_A = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
BUCK3, BUCK4, BUCK5						
V_{IN}	Power input voltage		3.0		5.5	V
V_{OUT}	DC output voltage VID range and options	VID step size = 10mV, BUCKx_VID[6:0] progresses from 0000001 to 1111111	0.41	See *Section 4*	1.67	V

7 Detailed Description

7.1 Overview

The TPS650864 power-management integrated circuit (PMIC) provides a highly flexible and configurable power solution that can power a wide array of processors along with DDR3/DDR4 memory and other peripherals. Integrated in the PMIC are three step-down controllers (BUCK1, BUCK2, and BUCK6), three step-down converters (BUCK3, BUCK4, and BUCK5), a sink or source LDO (VTT LDO), three low-voltage V_{IN} LDOs (LDOA1–LDOA3), and three load switches (SWA1, SWB1, and SWB2). With on-chip one-time programmable (OTP) memory, configuration of each rail for default output value, power-up sequence, fault handling, and Power Good mapping into a GPO pin are all conveniently flexible. All VRs have a built-in discharge resistor, and the value can be changed using the DISCHCNT1–DISCHCNT3 and LDOA1_SWB2_CTRL registers. When enabling a VR, the PMIC automatically disconnects the discharge resistor for that rail without any I^2C command. Table 7-1 lists the key characteristics of the voltage rails.

Table 7-1. Summary of Voltage Regulators

RAIL	TYPE	INPUT VOLTAGE (V)		OUTPUT VOLTAGE RANGE (V)			CURRENT (mA)
		MIN	MAX	MIN	TYP	MAX	
BUCK1	Step-down controller	4.5	21	0.41	See *Section 4*	3.575	scalable
BUCK2	Step-down controller	4.5	21	0.41	See *Section 4*	3.575	scalable
BUCK3	Step-down converter	3	5.5	0.41	See *Section 4*	3.575	3000
BUCK4	Step-down Converter	3	5.5	0.41	See *Section 4*	3.575	3000
BUCK5	Step-down converter	3	5.5	0.41	See *Section 4*	3.575	3000
BUCK6	Step-down controller	4.5	21	0.41	See *Section 4*	3.575	scalable
LDOA1	LDO	4.5	5.5	1.35	See *Section 4*	3.3	200(1)
LDOA2	LDO	1.62	1.98	0.7	See *Section 4*	1.5	600
LDOA3	LDO	1.62	1.98	0.7	See *Section 4*	1.5	600
SWA1	Load switch	0.5	3.3				300
SWB1/SWB2	Load switch	0.5	3.3				400
VTT	Sink and source LDO	1.1	1.8		FBVOUT6 / 2		See *Section 4*

(1) When powered from a 5V supply through the DRV5V_2_A1 pin. Otherwise, max current is limited by max I_{OUT} of LDO5.

7.2 Functional Block Diagram

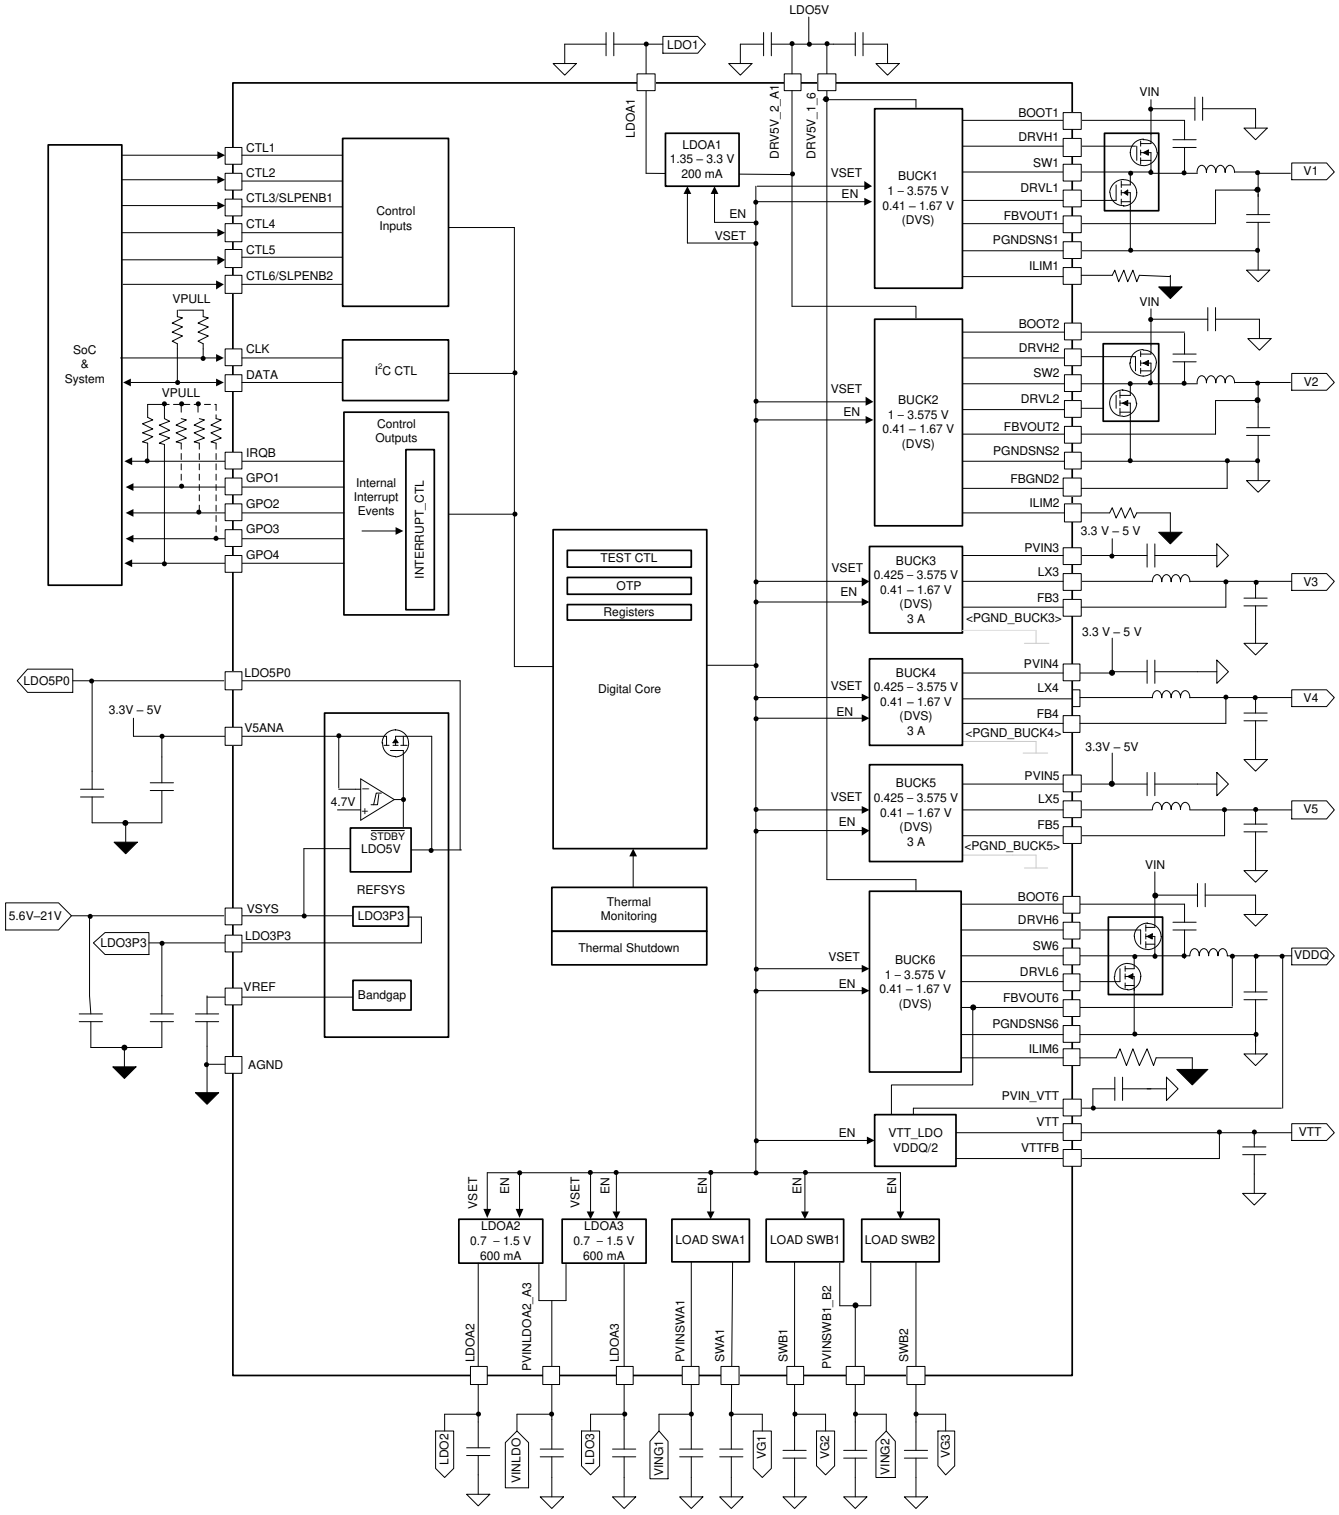

Figure 7-1. PMIC Functional Block Diagram

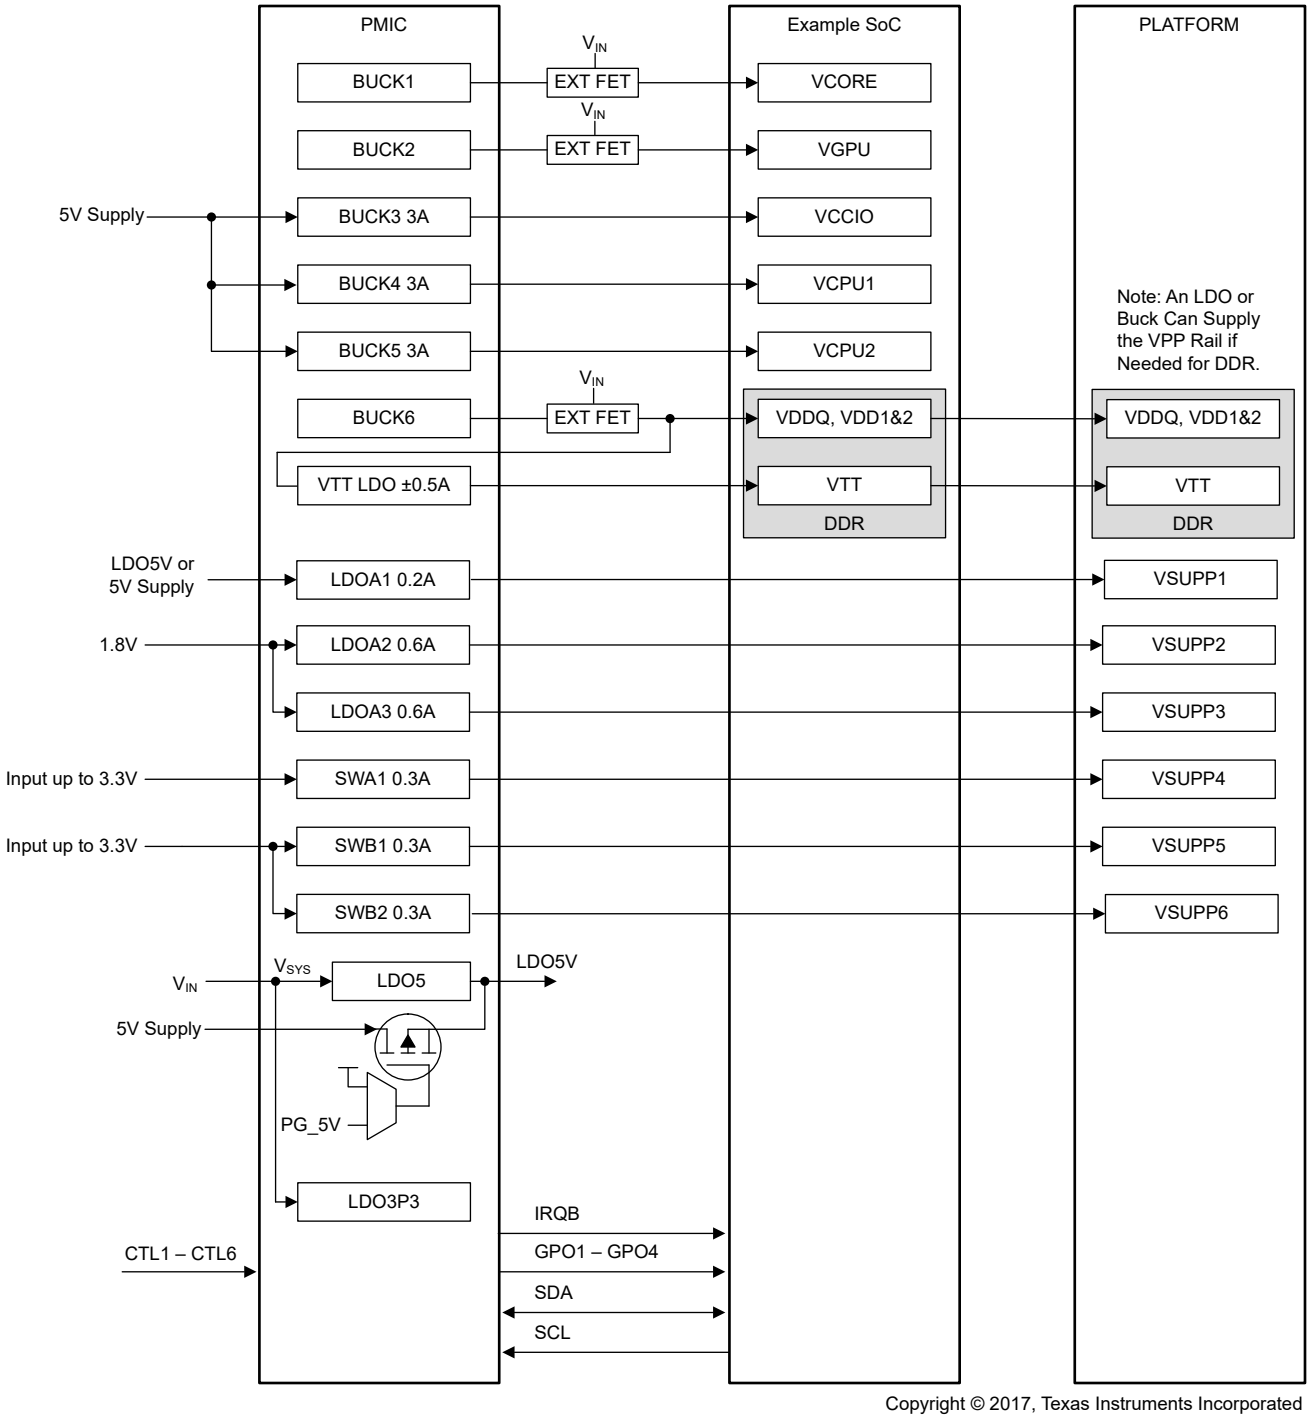

Figure 7-2. Power Map Example

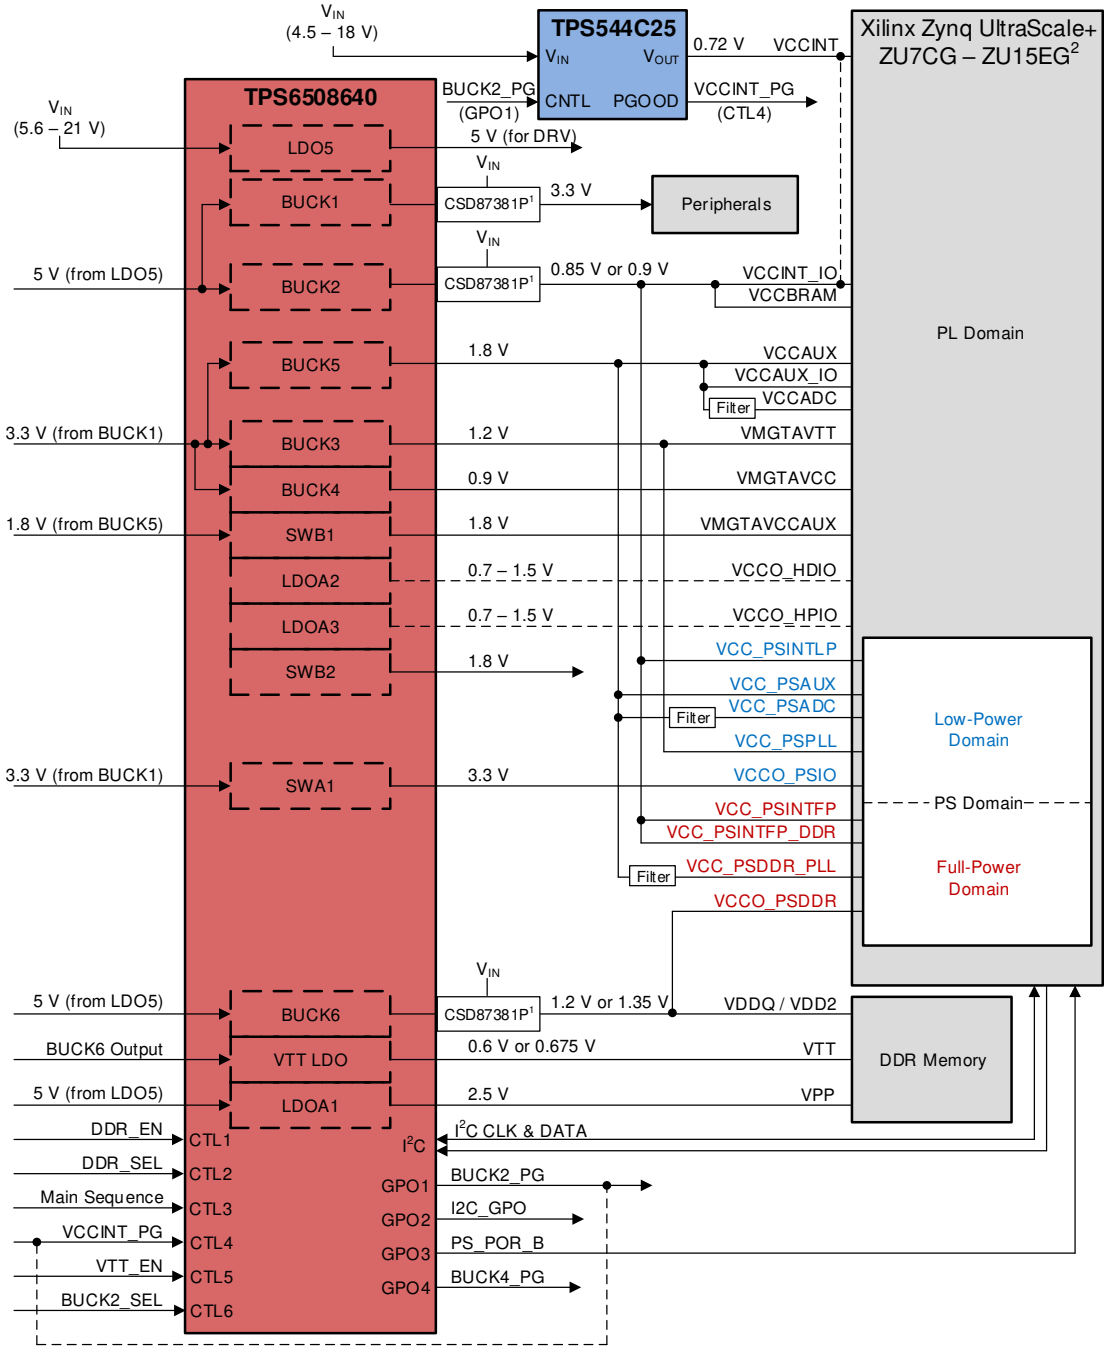
7.3 TPS6508640 Design and Settings

The TPS6508640 device is optimized to power the higher range of the Xilinx Zynq Ultrascale+ MPSoC, but is compatible with the lower range as well. See Figure 7-3 for an example block diagram. Dashed lines show the option to short VCCINT with VCCBRAM for cases where their voltages are the same and current < 25 A. In this case, the TPS544C25 device is not needed and GPO1 is shorted to CTL4.



(1) External FETs can be scaled to meet the current requirements of each design; CSD87381P is suitable up to approximately 15 A.
(2) The TPS6508640 is not limited to the ZU7CG - ZU15EG. It can support other Ultrascale+ devices as long as the use case does not exceed the maximum specifications of the TPS6508640.

Figure 7-3. TPS6508640 Power Map Example

The power up and power down sequences can be seen in Figure 7-4 and Figure 7-5. Regulators and GPOs are enabled by combination of CTL pins and regulator power good signals.

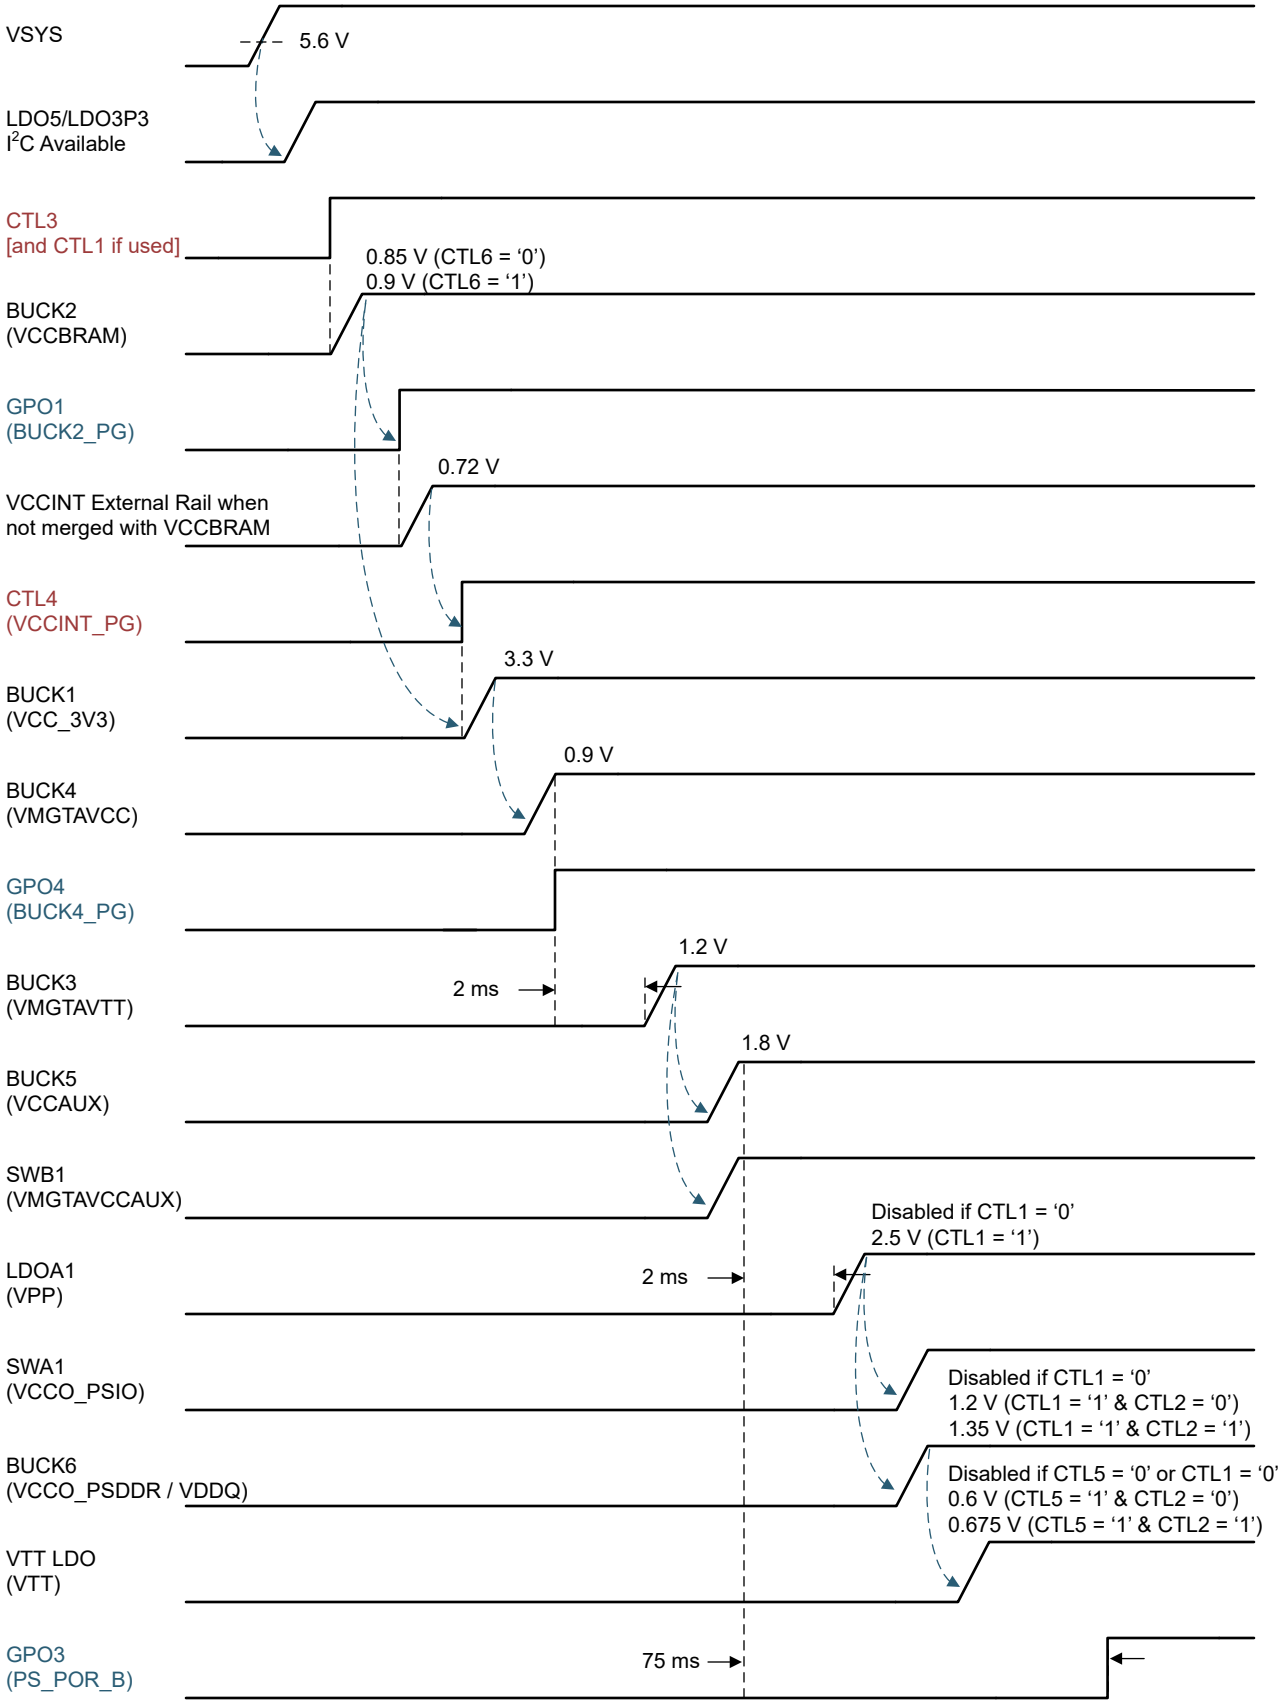


Figure 7-4. TPS6508640 Power-Up Sequence

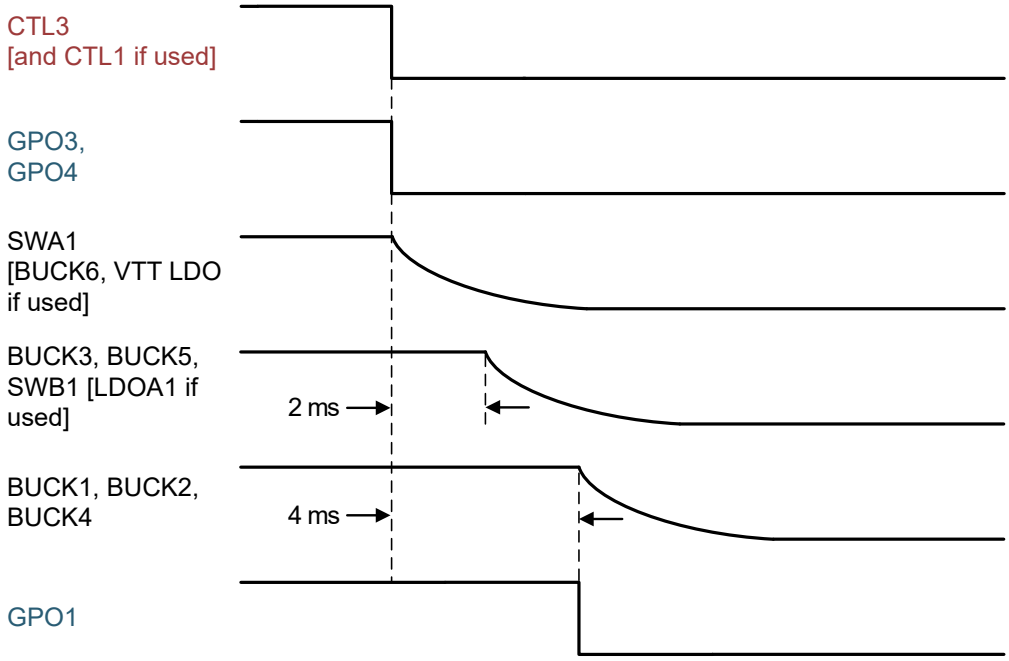

Figure 7-5. TPS6508640 Power-Down Sequence

TPS6508640 sequence includes an optional slot for an external rail to power VCCINT. When using an external rail, GPO1 must be connected to the enable of the external rail and the power good of the external rail must be connected to CTL4. When merging VCCINT and VCCBRAM, GPO1 can be connected directly to CTL4.

CTL1 and CTL5 are used to enable the portion of the sequencing related to DDR memory. This includes BUCK6, LDOA1, and VTT LDO. Connecting the CTL1 pin to the same input as CTL3 results in BUCK6 being enabled 2 ms after BUCK5 and LDOA1 being enabled after BUCK6 PG. If CTL5 is connected to the same input as well, VTT LDO turns on after BUCK6 PG as well.

CTL2 is used to select DDR voltage between 1.2 V (logic level low) and 1.35 V (logic level high).

CTL6 is used to select BUCK2 (VCCBRAM) voltage between 0.85 V (logic level low) and 0.9 V (logic level high). BUCK3 also has SLP_EN = 1b by default, so if using 0.85 V for VCCBRAM (CTL6 logic level low), then to modify BUCK3 VID during operation, BUCK3_SLP_VID register bits must be used.

LDOA2 and LDOA3 are controlled only by I^2C.

A summary of the part number specific settings can be seen in Section 7.3.1.

7.3.1 TPS6508640 OTP Summary

The following tables list the TPS6508640 device settings for the buck regulators, general purpose LDOs, VTT LDO, load switches, and GPOs. LDOA1 is used in sequence so all registers with SWB2_LDOA1 functions as LDOA1. Additionally, SWB1 and SWB2 are not merged so all registers with LDOA1_SWB2 functions as SWB2. All values which can be modified by I^2C after power on are shown in italics. Additional details (such as GPO power good inputs) can be found in the register map.

Table 7-2. TPS6508640 Settings Summary—Buck Regulators

REGULATOR	DEFAULT VOLTAGE	SLEEP VOLTAGE	STEP SIZE	SLP PIN	SLP_EN	POWER FAULT MASKED	FORCE PWM
BUCK1	*3.3 V*	*3.3 V*	25 mV	CTL6	*No*	*No*	*Yes*
BUCK2	*0.9 V*	*0.85 V*	10 mV	CTL6	*Yes*	*No*	*Yes*

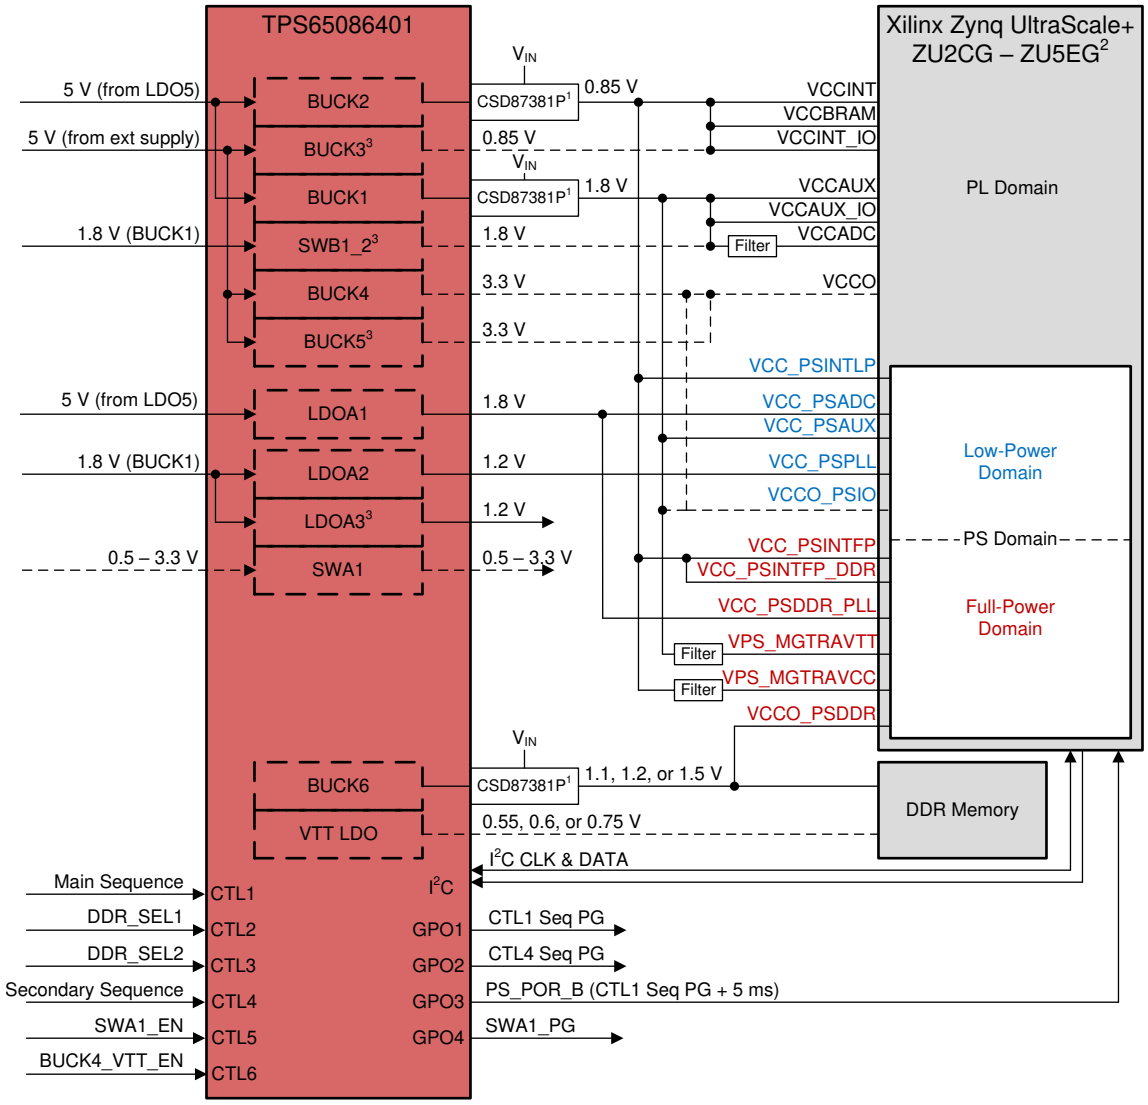
7.4 TPS65086401 Design and Settings

The TPS65086401 device is intended to power the lower range of the Xilinx Zynq Ultrascale+ platform. An example block diagram for this system can be seen in Figure 7-6.



(1) External FETs can be scaled to meet the current requirements of each design; CSD87381P is suitable up to approximately 15 A.
(2) The TPS65086401 is not limited to the ZU2CG - ZU5EG. It can support other Ultrascale+ devices as long as the use case does not exceed the maximum specifications of the TPS65086401.
(3) PL Domain can be optionally powered by BUCK3, SWB1_2, BUCK5, and LDOA3 to allow it to be enabled and disabled by CTL4. This applies only to use cases where VCCINT current is less than 3 A.

Figure 7-6. TPS65086401 Power Map Example

The power up and power down sequences can be seen in Figure 7-7 and Figure 8-8. Regulators and GPOs are enabled by combination of CTL pins and regulator power good signals.

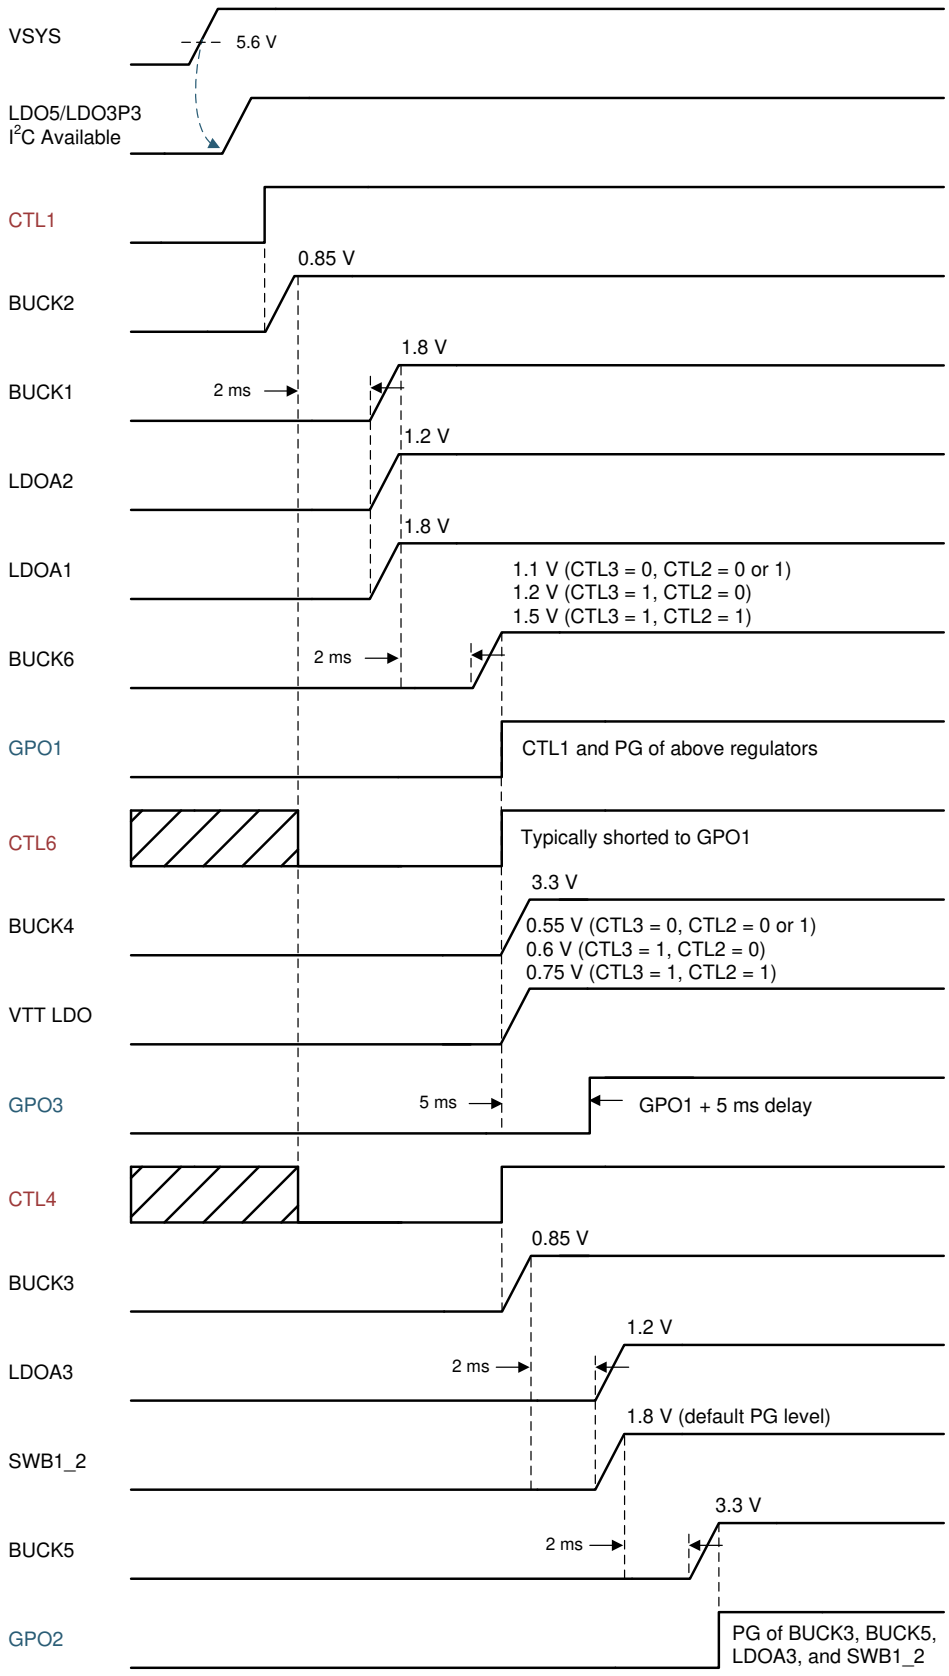


Figure 7-7. TPS65086401 Power-Up Sequence

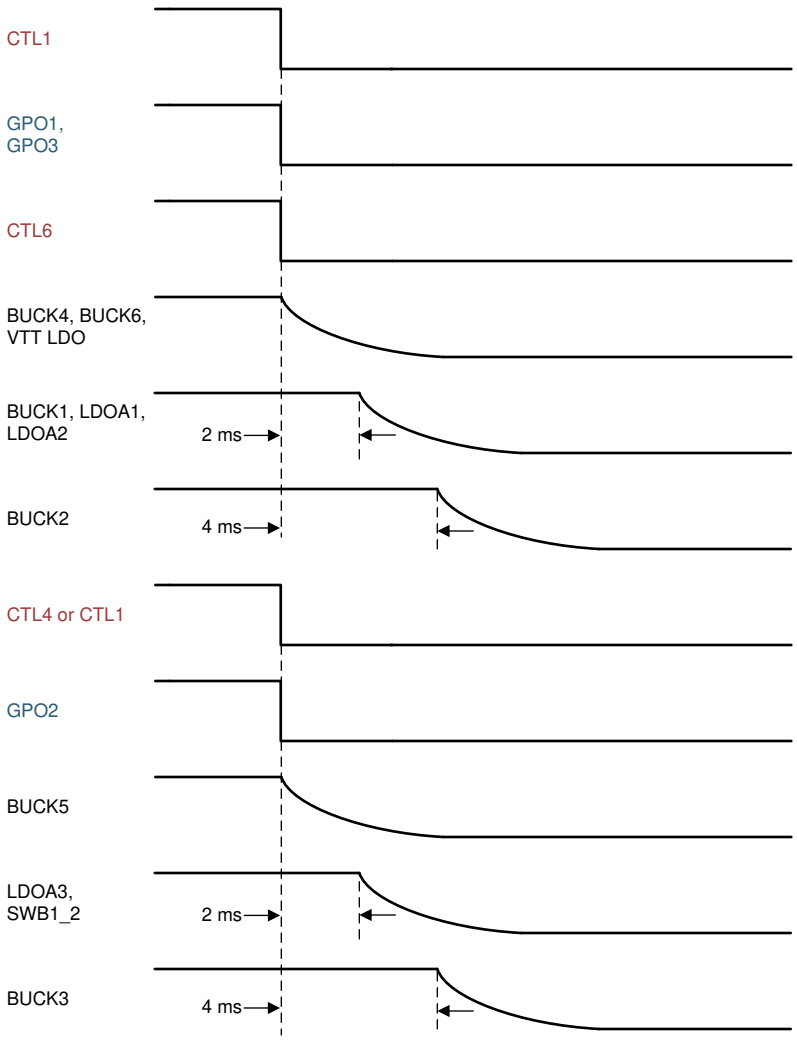

Figure 7-8. TPS65086401 Power-Down Sequence

CTL1 is used to enable the general system, CTL6 is typically connected to GPO1, and CTL4 can be used or not used depending on the application. CTL5 enables SWA1 independently of the rest of the sequence. CTL2 and CTL3 are used for BUCK6 voltage selection.

A summary of the part number specific settings can be seen in Section 7.4.1.

7.4.1 TPS65086401 OTP Summary

The following tables list the TPS65086401 device settings for the buck regulators, general purpose LDOs, VTT LDO, load switches, and GPOs. LDOA1 is used in sequence so all registers with SWB2_LDOA1 functions as LDOA1. Additionally, SWB1 and SWB2 are merged so all registers with LDOA1_SWB2 are unused. All values which can be modified by I^2C after power on are shown in italics. Additional details (such as GPO power good inputs) can be found in the register map.

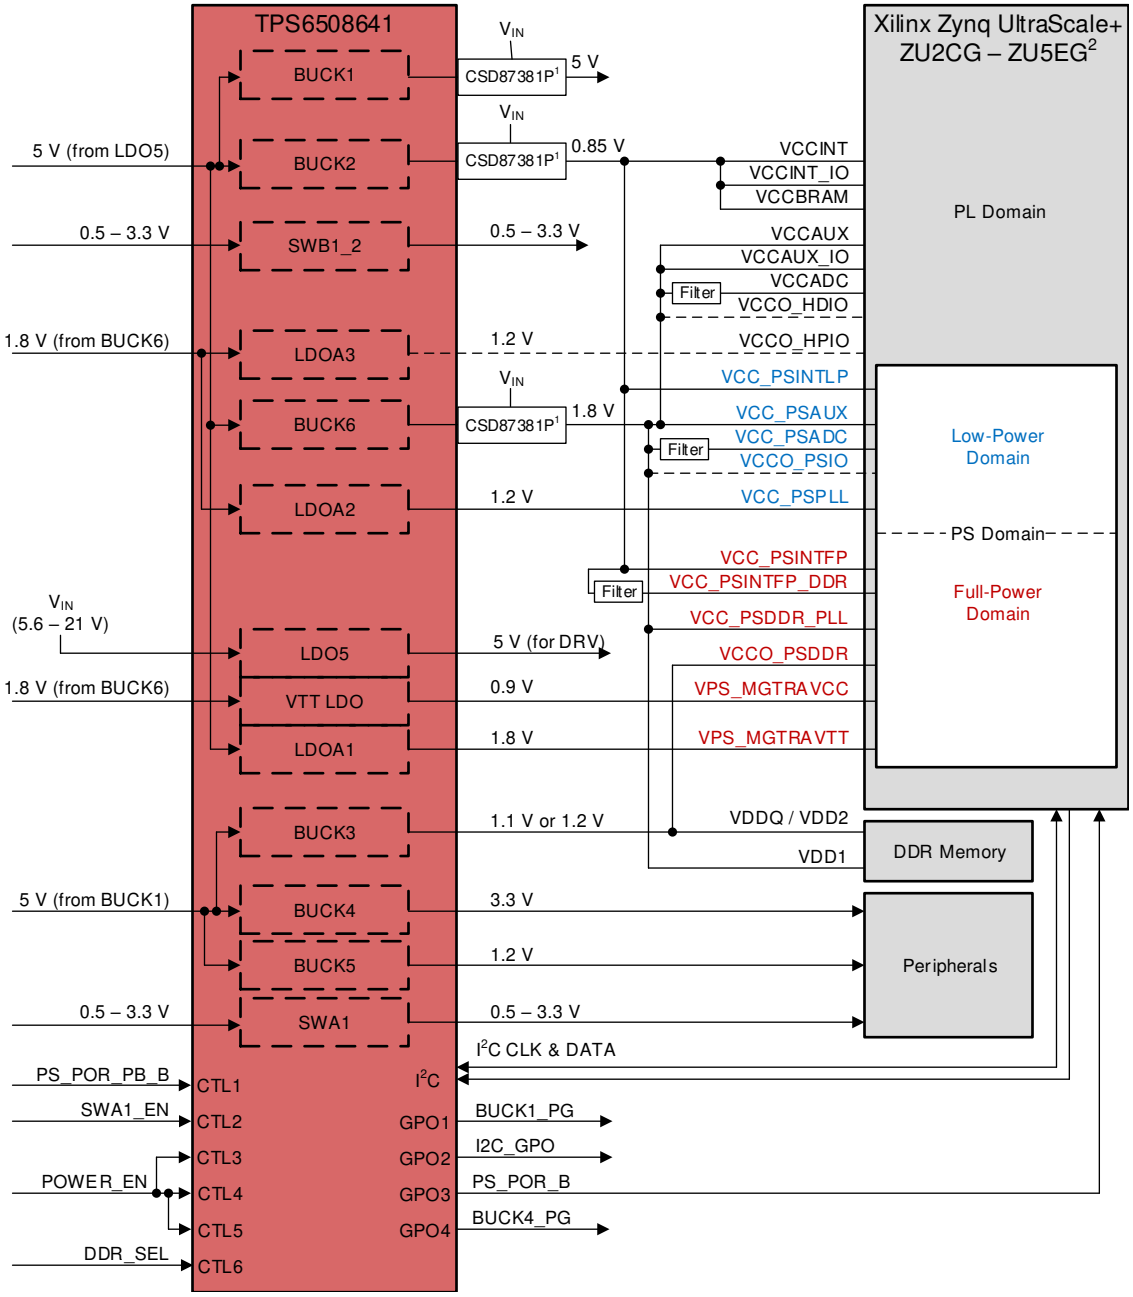
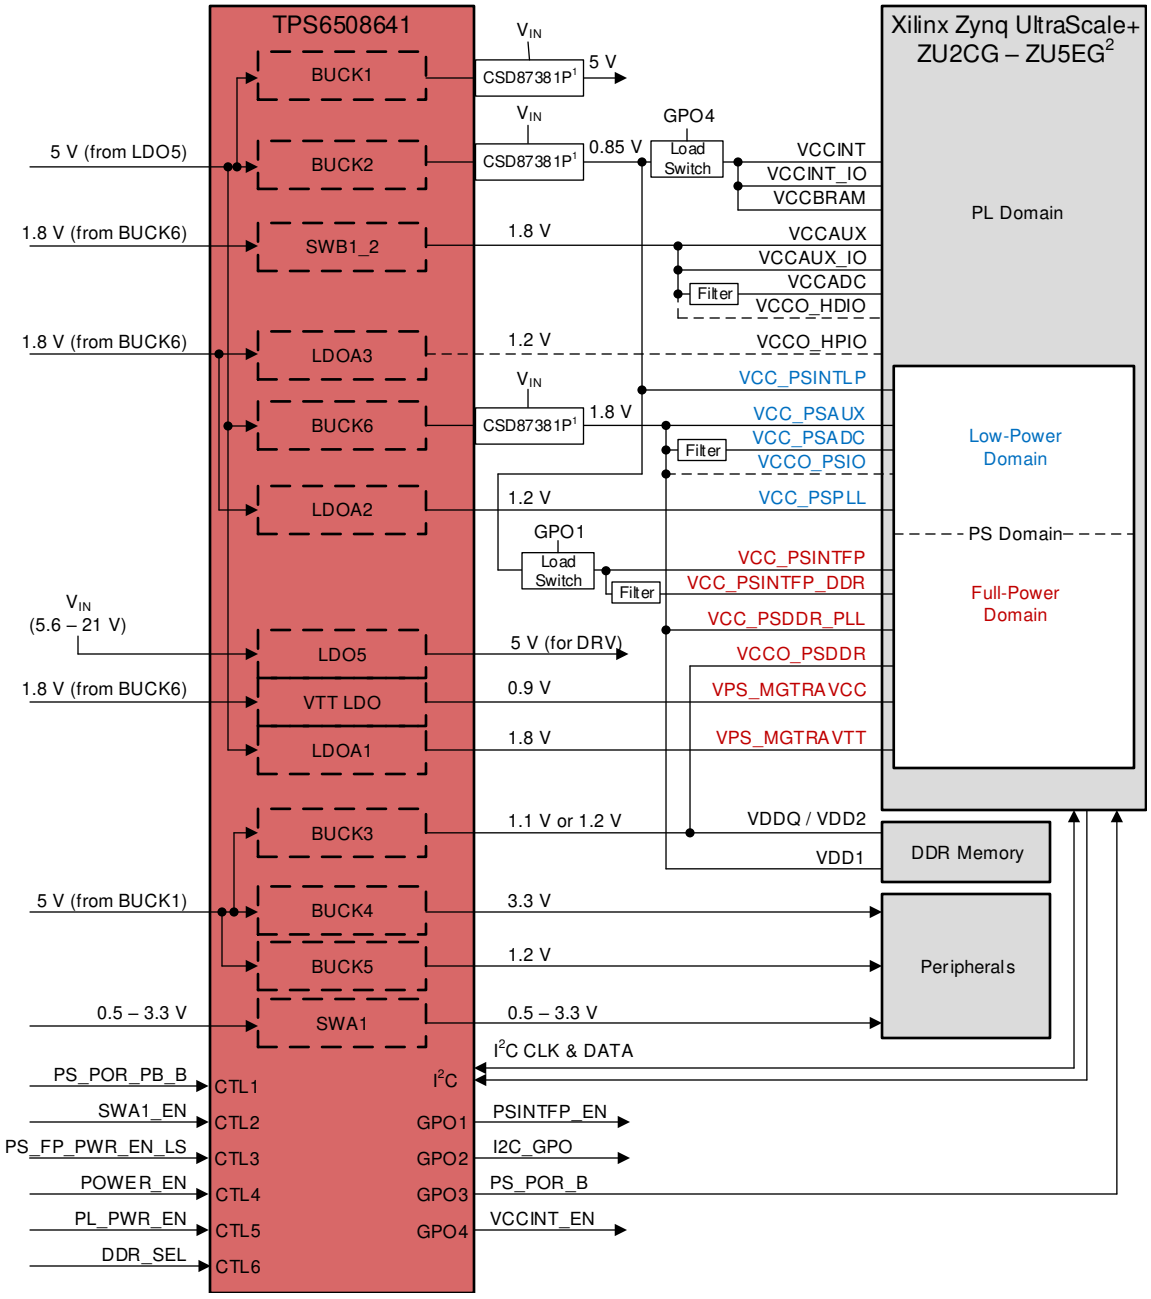
7.5 TPS6508641 Design and Settings

The TPS6508641 device is intended to power the lower range of the Xilinx Zynq Ultrascale+ platform. The TPS6508641 device removes the need for an external 5 V regulator when compared with the TPS65086401 device and also supports a wider variety of Zynq Ultrascale+ power states. Figure 7-9 shows a simple example block diagram for an always-on system, while Figure 7-10 shows a block diagram for full power domain flexibility. See Xilinx's Ultrascale Architecture PCB Design for explanation of the power supply configurations.



(1) External FETs can be scaled to meet the current requirements of each design; CSD87381P is suitable up to approximately 15 A.
(2) The TPS6508641 is not limited to the ZU2CG - ZU5EG. It can support other Ultrascale+ devices as long as the use case does not exceed the maximum specifications of the TPS6508641.

Figure 7-9. TPS6508641 Always-On Power Map Example



(1) External FETs can be scaled to meet the current requirements of each design; CSD87381P is suitable up to approximately 15 A.
(2) The TPS6508641 is not limited to the ZU2CG - ZU5EG. It can support other Ultrascale+ devices as long as the use case does not exceed the maximum specifications of the TPS6508641.

Figure 7-10. TPS6508641 Full Power Domain Flexibility Power Map Example

The power up and power down sequences can be seen in Figure 7-11 and Figure 7-12. Regulators and GPOs are enabled by combination of CTL pins and regulator power good signals.

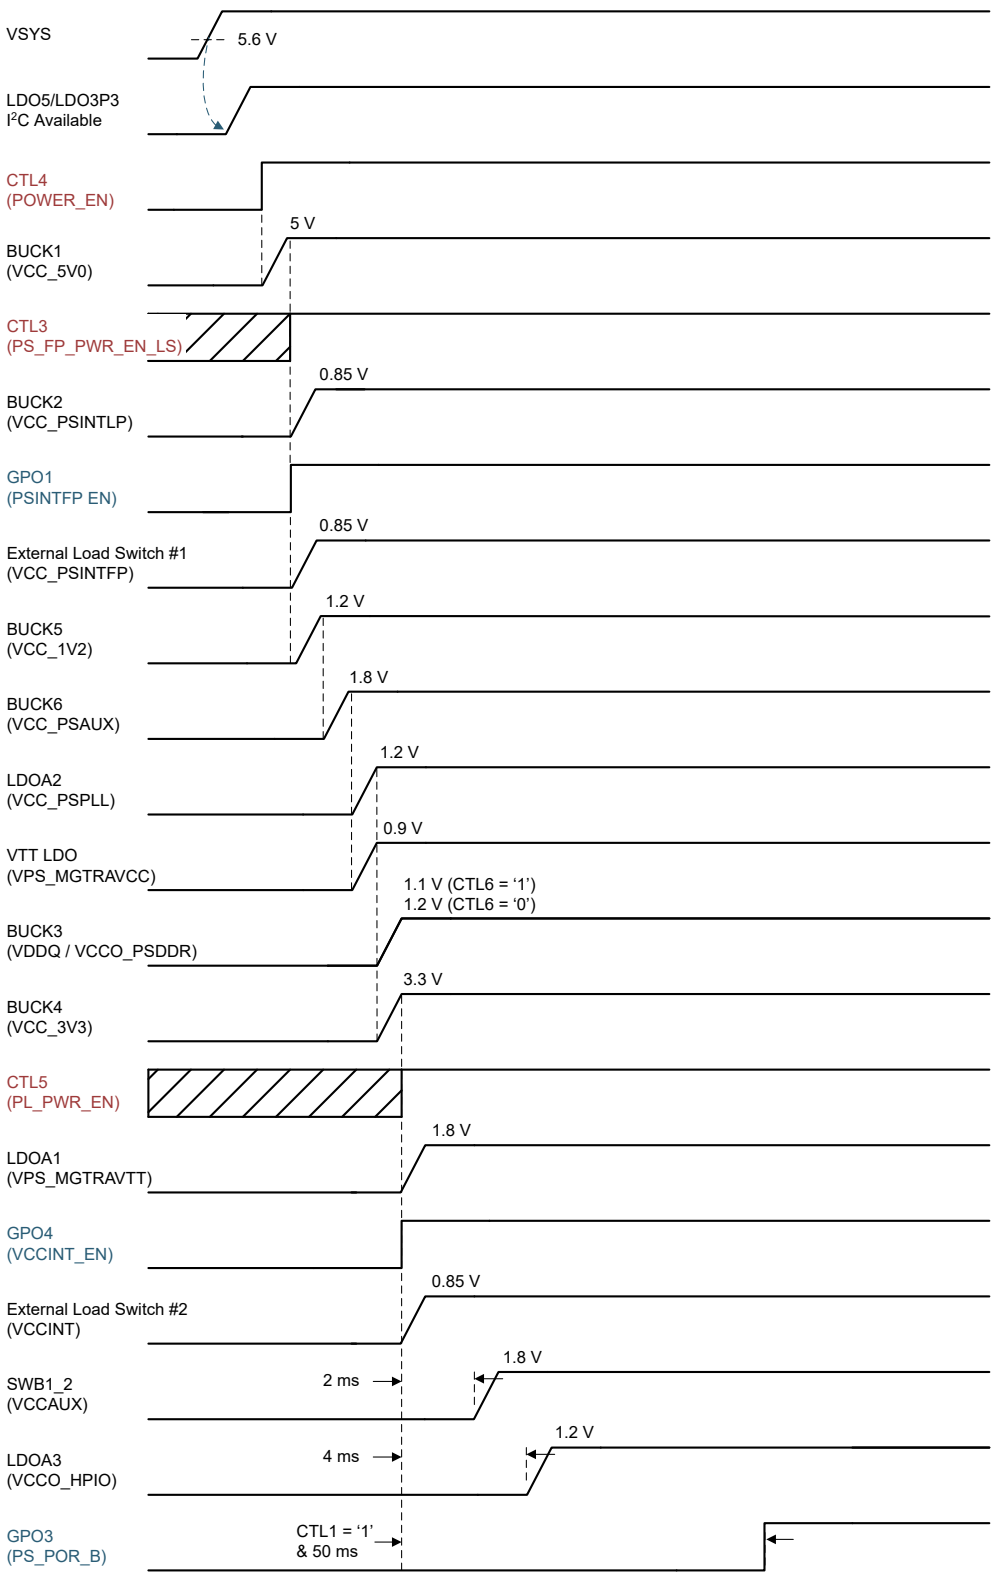


Figure 7-11. TPS6508641 Power-Up Sequence

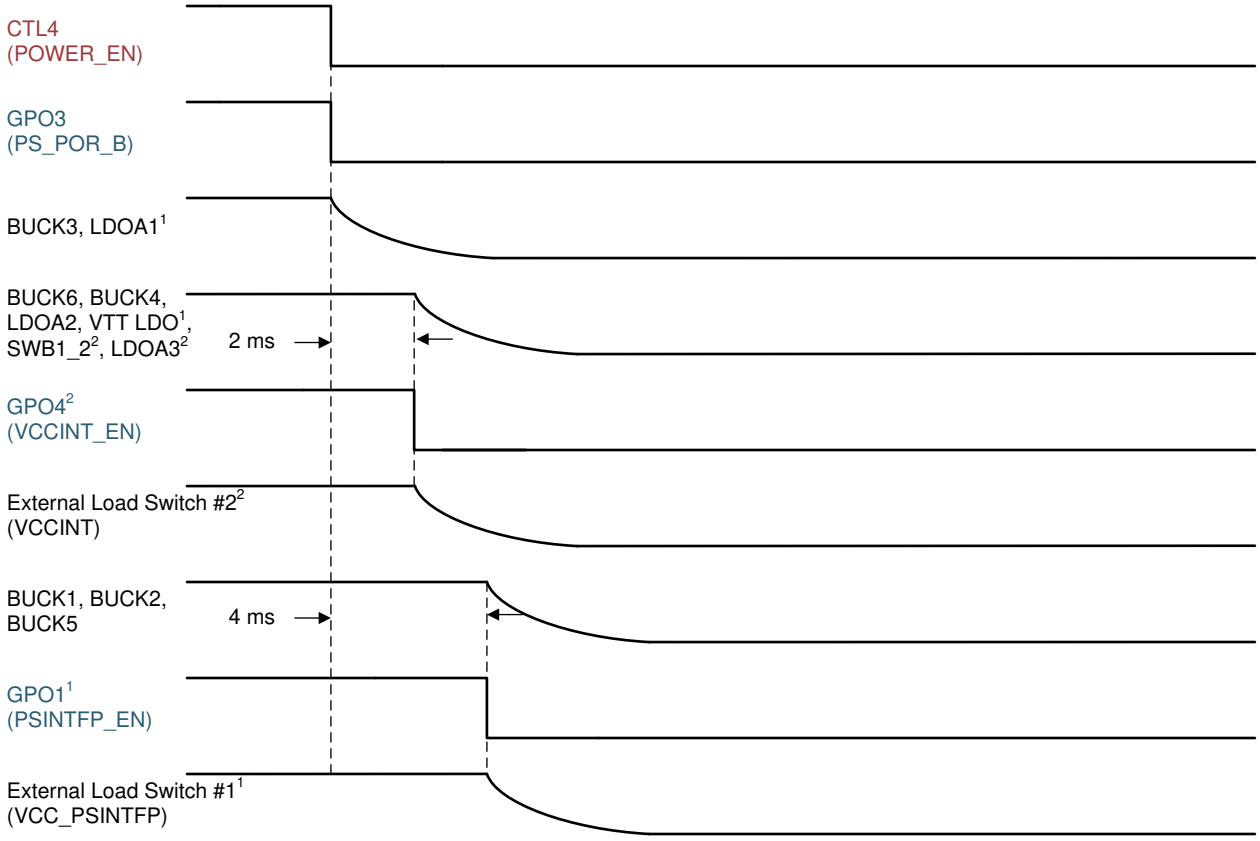

(1) Sequence shown assumes CTL3 is high. If CTL3 is set low before this point, these voltage regulators are already disabled.
(2) Sequence shown assumes CTL5 is high. If CTL5 is set low before this point, these voltage regulators are already disabled.

Figure 7-12. TPS6508641 Power-Down Sequence

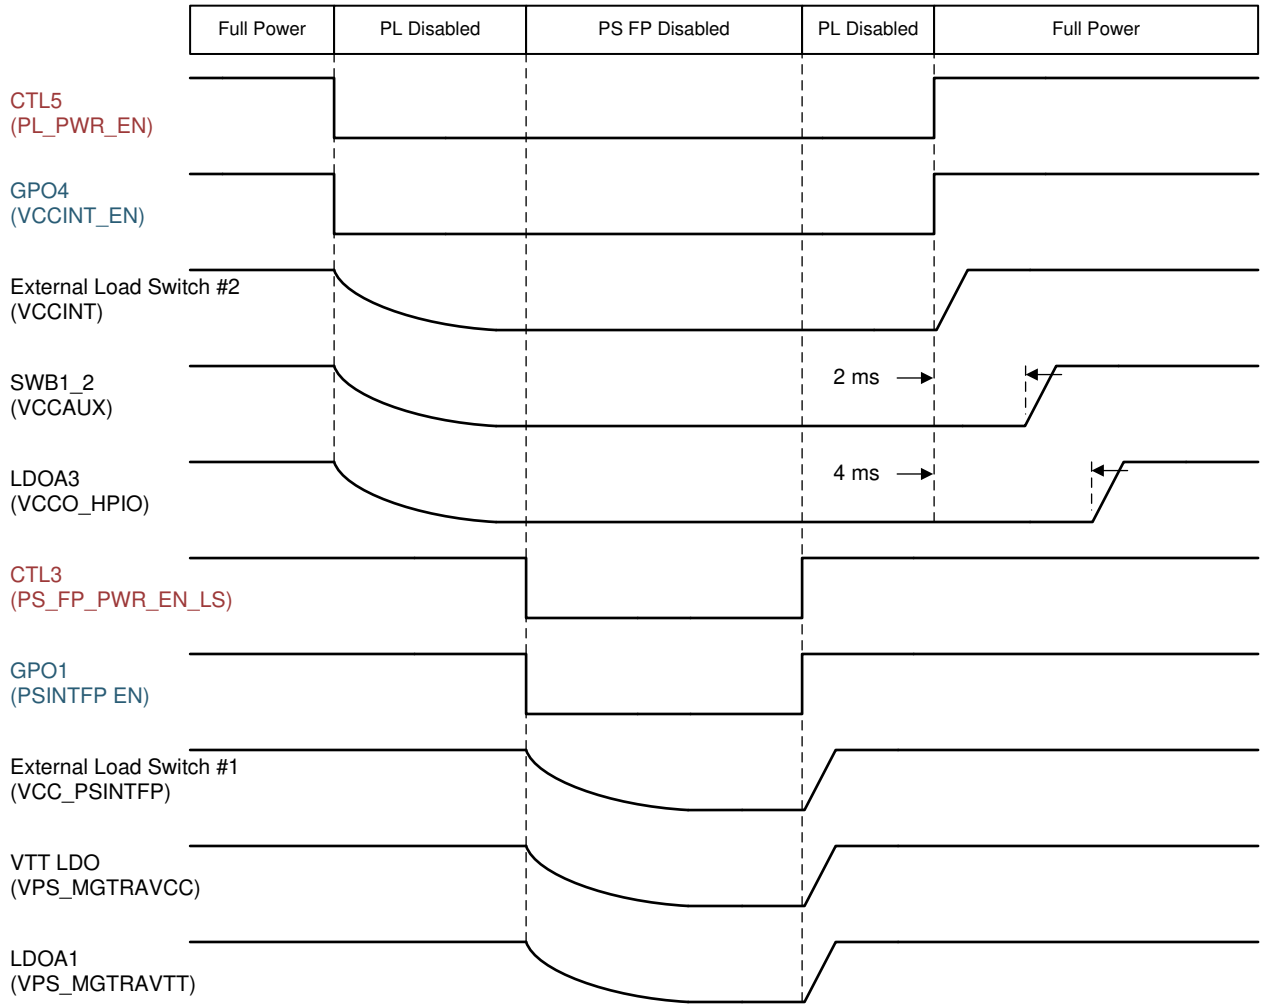

Figure 7-13. TPS6508641 Low Power States

The TPS6508641 device is designed to be able to support always on and full power domain flexibility power modes. The low power states can be omitted if not required.

CTL4 is used to start the primary power sequence and CTL1, CTL3, and CTL5 must all be high initially to complete the power up sequence. For always-on case, CTL3 and CTL5 can be shorted with CTL4.

CTL6 is used to select BUCK3 voltage between BUCK3_VID and BUCK3_SLP_VID register bits. Logic level low results in 1.2 V while logic level high results in 1.1 V.

CTL2 is used to enable and disable SWA1 and is independent of the rest of the sequence.

When CTL1 is set low, GPO3 (PS_POR_B) is set low regardless of the power state and has 50 ms delay before going high after CTL1 goes high. GPO3 is used as a reset for the Zynq Ultrascale+ device. GPO3 can be pulled up to LDO3P3 (3.3 V) or BUCK6 (1.8 V) as preferred with a 10 kΩ resistor and a pushbutton can short CTL1 to GND when MPSoC reset is desired.

GPO1 and GPO4 are used to control load switches when utilizing the low power modes. The load switches can be omitted for cases where low power modes are not necessary.

VTT LDO voltage used to power VPS_MGTRAVCC is configured to 0.9 V in order to support all variant speeds, including -3E designs. VTT LDO is within the absolute voltage range and is not expected to impact performance for non-3E designs based on testing with the Ultra96 board. For more information on VPS_MGTRAVCC voltage,

see Xilinx's Ultrascale Architecture PCB Design, *Table 7-2 MPSoC PS Voltage Matrix by Speed/Temperature Grade*.

A summary of the part number specific settings can be seen in Section 7.5.1.

7.5.1 TPS6508641 OTP Summary

The following tables list the TPS6508641 device settings for the buck regulators, general purpose LDOs, VTT LDO, load switches, and GPOs. LDOA1 is used in sequence so all registers with SWB2_LDOA1 function as LDOA1. Additionally, SWB1 and SWB2 are merged so all registers with LDOA1_SWB2 are unused. All values which can be modified by I^2C after power on are shown in italics. Additional details (such as GPO power good inputs) can be found in the register map.

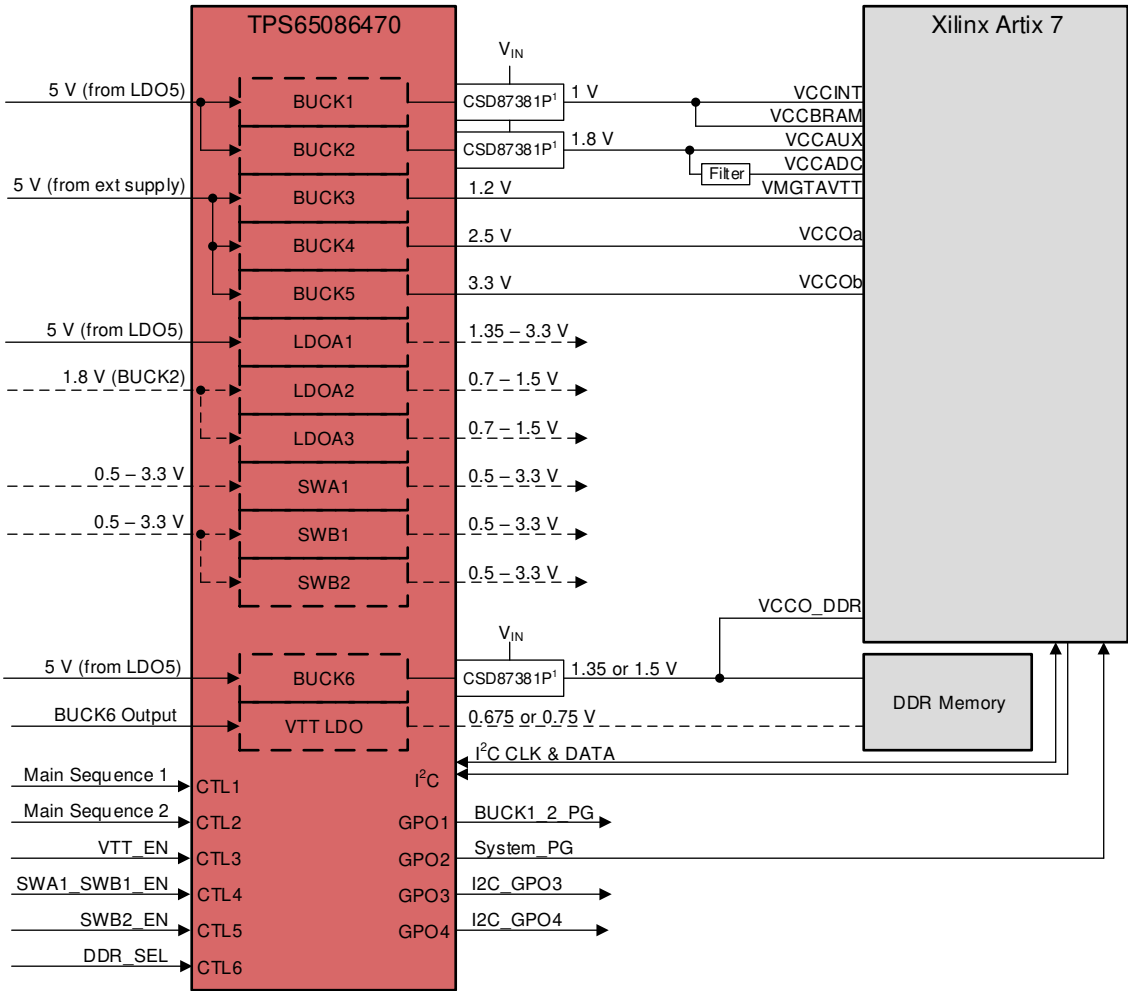
7.6 TPS65086470 Design and Settings

The TPS65086470 device is originally intended to power a Xilinx Artix 7 platform. Figure 7-14 shows an example block diagram for this system.



(1) External FETs can be scaled to meet the current requirements of each design; CSD87381P is suitable up to approximately 15 A.

Figure 7-14. TPS65086470 Power Map Example

Figure 7-15 and Figure 7-16 show the power-up and power-down sequences. Regulators and GPOs are enabled by combination of CTL pins and regulator power good signals.

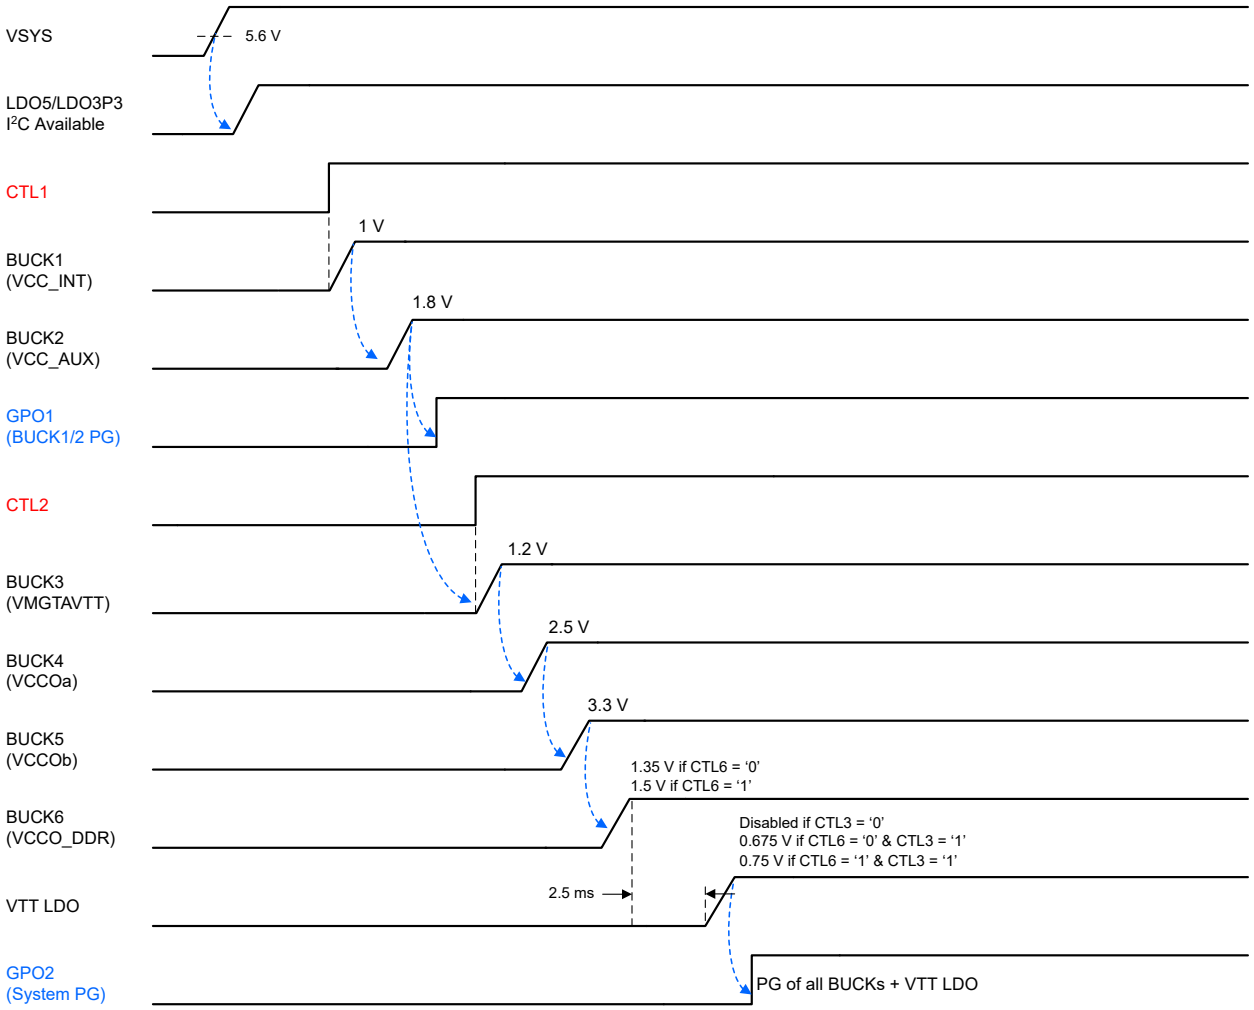


Figure 7-15. TPS65086470 Power-Up Sequence

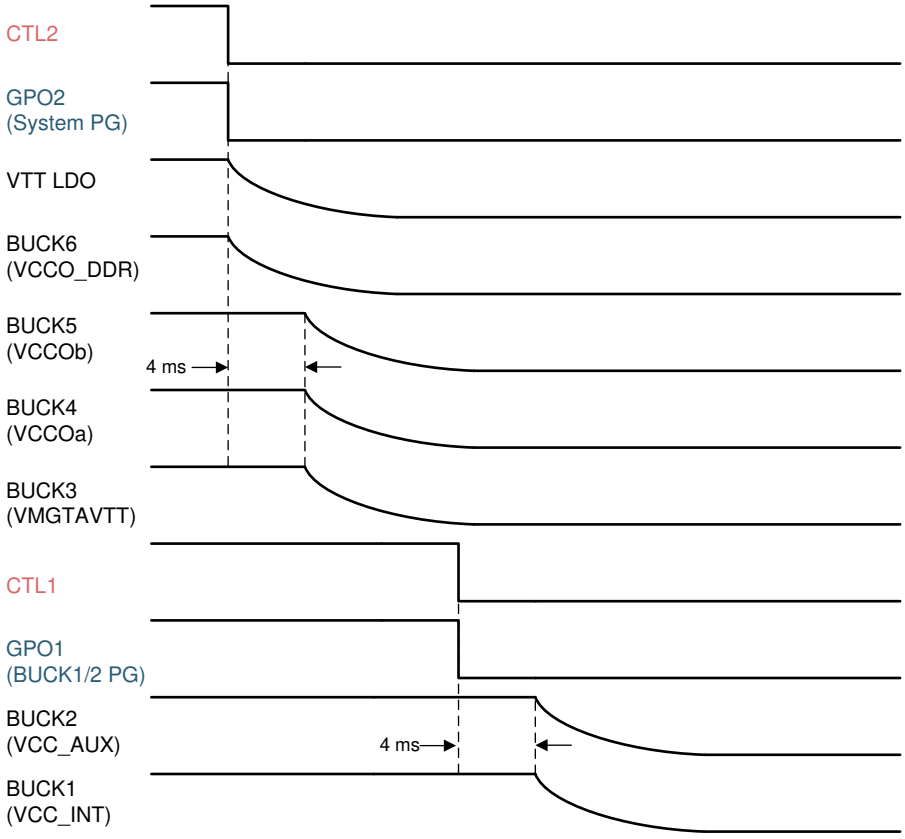

Figure 7-16. TPS65086470 Power-Down Sequence

If CTL1 and CTL2 are set low at the same time, both sequences occur simultaneously. If CTL1 is set low before CTL2, GPO1 and GPO2 goes low and remaining bucks are disabled as their PG enable is lost. For example, as BUCK2 is disabled after 4 ms, BUCK3 starts its 4 ms delay. As such, it is recommended to not set CTL1 low before CTL2.

Additionally, CTL4 can be used to enable SWA1 and SWB1. CTL5 can be used to enable SWB2. LDOA2 and LDOA3 are controlled only by I^2C.

A summary of the part number specific settings can be seen in Section 7.6.1.

7.6.1 TPS65086470 OTP Summary

The following tables list the TPS65086470 device settings for the buck regulators (Table 7-17), general purpose LDOs (Table 7-18), VTT LDO (Table 7-19), load switches (Table 7-20), and GPOs (Table 7-21). LDOA1 is not used in sequence so all registers with LDOA1_SWB2 function as LDOA1. Additionally, SWB1 and SWB2 are not merged so all registers with SWB2_LDOA1 function as SWB2. All values which can be modified by I^2C after power on are shown in italics. Additional details (such as GPO power good inputs) can be found in the register map.

Table 7-17. TPS65086470 Settings Summary—Buck Regulators

7.7 SMPS Voltage Regulators

The buck controllers integrate gate drivers for external power stages with programmable current limit (set by an external resistor at ILIMx pin), which allows for optimal selection of external passive components based on the desired system load. The buck converters include integrated power stage and require a minimum number of pins for power input, inductor, and output voltage feedback input. Combined with high-frequency switching, all these features allow use of inductors in small form factor, thus reducing total-system cost and size.

BUCK1–BUCK6 have selectable auto- and forced-pulse width modulation (PWM) mode through the BUCKx_MODE bit in the BUCKxCTRL register. In default auto mode, the VR automatically switches between PWM and pulsed frequency modulation (PFM) depending on the output load to maximize efficiency.

All controllers and converters can be used with the default V_{OUT} or can have their voltage dynamically changed at any time. Rails can be default programmed for any available V_{OUT} by OTP programming at the factory, so the device starts up with the default voltage, or during operation, the rail can be configured by I^2C to another operating V_{OUT} value while the rail is enable or disabled. There are two step sizes or ranges available for V_{OUT} selection : 10-mV and 25-mV steps. The step-size range must be selected prior to use and must be programmed in the OTP at the factory. The step size is not subject to change during operation.

For the 10mV step-size range V_{OUT} options, see Table 7-22. For the 25mV step-size range V_{OUT} options, see Table 7-23.

Table 7-22. 10mV Step-Size V_{OUT} Range

7.7.1 Controller Overview

The controllers are fast-reacting, high-frequency, scalable output power controllers capable of driving two external N-MOSFETs. They are D-CAP2 controller scheme that optimizes transient responses at high load currents for such applications as CORE and DDR supplies. The output voltage is compared with internal reference voltage after divider resistors. The PWM comparator determines the timing to turn on the high-side MOSFET. The PWM comparator response maintains a very small PWM output ripple voltage. Because the device does not have a dedicated oscillator for control loop on board, switching cycle is controlled by the adaptive on-time circuit. The on-time is controlled to meet the target switching frequency by feed-forwarding the input and output voltage into the on-time one-shot timer.

The D-CAP2 control scheme has an injected ripple from the SW node that is added to the reference voltage to simulate output ripple, which eliminates the need for ESR-induced output ripple from D-CAP™ mode control. Thus, low-ESR output capacitors (such as low-cost ceramic MLCC capacitors) can be used with the controllers.

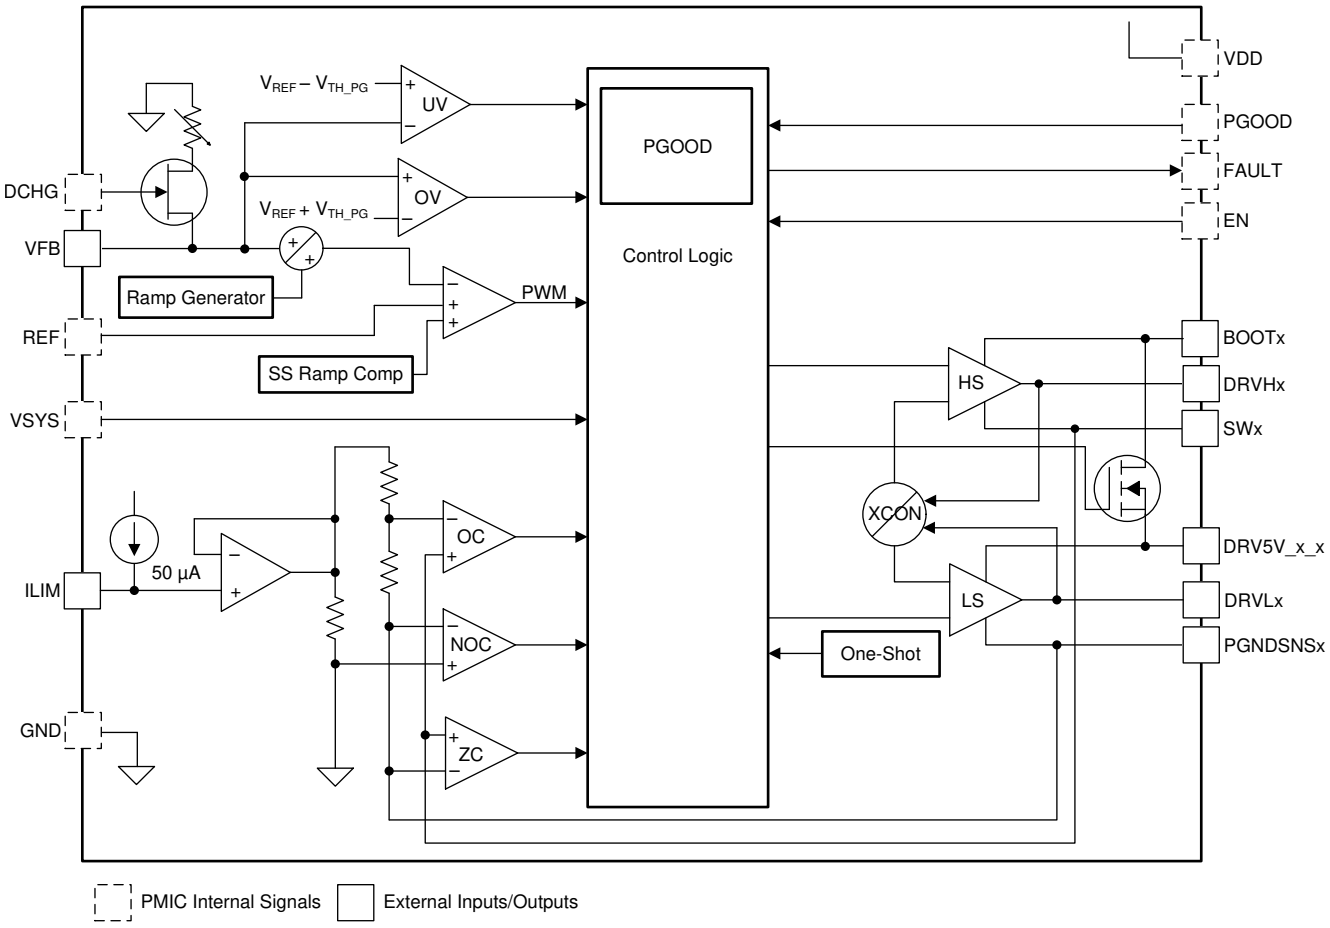

Figure 7-17. Controller Block Diagram

7.7.2 Converter Overview

The PMIC synchronous step-down DCDC converters include a unique hysteretic PWM controller scheme which enables a high switching frequency converter, excellent transient and AC load regulation as well as operation with cost-competitive external components. The converter topology supports forced PWM mode as well as power-save mode operation. Power-save mode operation, or PFM mode, reduces the quiescent current consumption and ensures high conversion efficiency at light loads by skipping switch pulses. In forced PWM mode, the device operates on a quasi-fixed frequency, avoids pulse skipping, and allows filtering of the switch noise by external filter components. The PMIC device offers fixed output voltage options featuring smallest solution size by using only three external components per converter.

A significant advantage of PMIC compared to other hysteretic PWM controller topologies is its excellent AC load transient regulation capability. When the output voltage falls below the threshold of the error comparator, a switch pulse is initiated, and the high-side switch is turned on. The high-side switch remains turned on until a minimum ON-time of t_{ONmin} expires and the output voltage trips the threshold of the error comparator or the inductor current reaches the high-side switch current limit. When the high-side switch turns off, the low-side switch rectifier is turned on and the inductor current ramps down until the high-side switch turns on again or the inductor current reaches zero. In forced PWM mode operation, negative inductor current is allowed to enable continuous conduction mode even at no load condition.

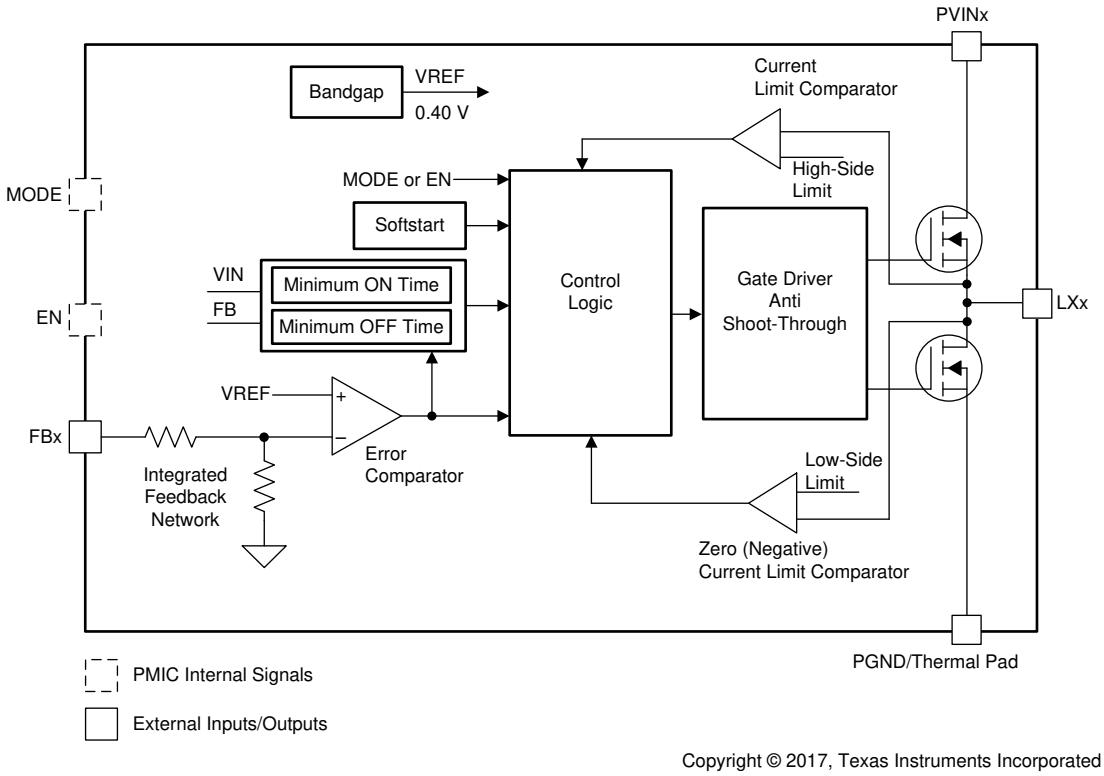

Figure 7-18. Converter Block Diagram

7.7.3 DVS

BUCK1–BUCK6 support dynamic voltage scaling (DVS) for maximum system efficiency. The VR outputs can slew up and down in 25mV steps for the converters, and either 10mV or 25mV steps for the controllers, using the 7-bit voltage ID (VID) defined in Section 6.7 and Section 6.8. DVS slew rate is minimum 2.5mV/µs. In order to meet the minimum slew rate, VID progresses to the next code at 3µs (nom) interval per 10mV or at 6µs interval per 25mV steps. When DVS is active, the VR is forced into PWM mode, unless BUCKx_DECAY = 1, to ensure the output keeps track of VID code with minimal delay. Additionally, PGOOD is masked when DVS is in progress. Figure 7-19 shows an example of slew down and up from one VID to another (step size of 10 mV).

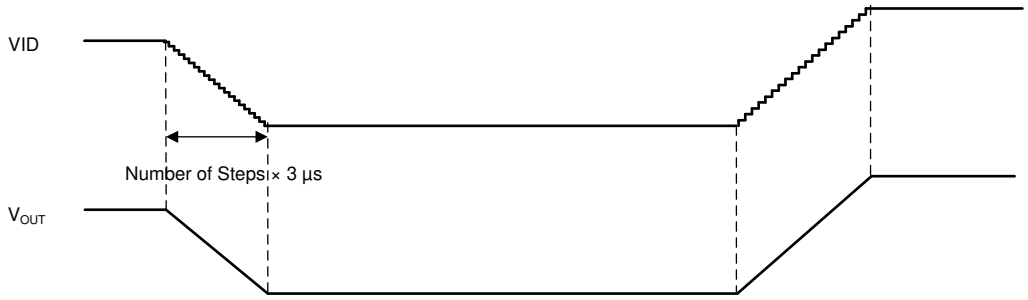

Figure 7-19. DVS Timing Diagram I (BUCKx_DECAY = 0)

As shown in Figure 7-20, if BUCKx_VID[6:0] is set to 7b000 0000, its output voltage slews down to 0.5V first, and then drifts down to 0 V as the SMPS stops switching. Subsequently, if BUCKx_VID[6:0] is set to a value (neither 7b000 0000 nor 7b000 0001) when its output voltage is less than 0.5 V, the VR ramps up to 0.5 V first with soft-start kicking in, then slews up to target voltage in the slew rate mentioned previously. A fixed 200µs of soft-start time is reserved for V_{OUT} to reach 0.5 V. In this case, however, the SMPS is not forced into PWM mode as it otherwise causes V_{OUT} to droop momentarily if V_{OUT} might have been drifting above 0.5V for any reason.

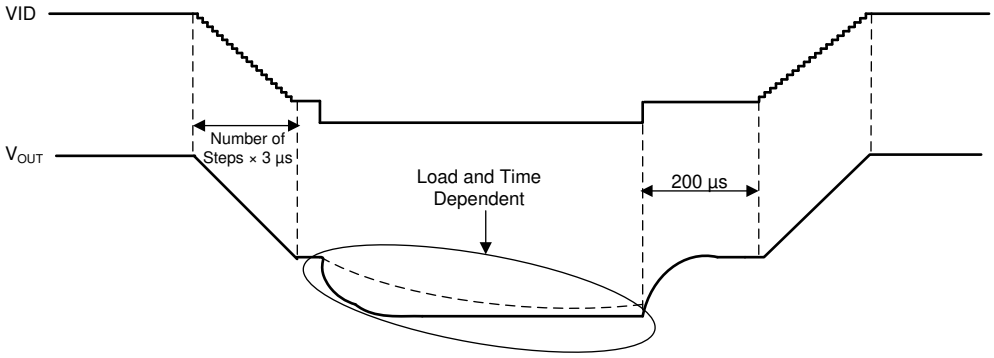

Figure 7-20. DVS Timing Diagram II (BUCKx_DECAY = 0)

7.7.4 Decay

In addition to DVS, BUCK1–BUCK6 can decay down to a lower voltage when BUCKx_DECAY bit in BUCKxCTRL register is set to 1. Decay mode is only used in a downward direction of VID. The VR does not control slew rate. As both high-side and low-side FETs stop switching, the output voltage ramps down naturally, dictated by current drawn from the load and output filtering capacitance. When the VR is in the middle of decay down its PGOOD is masked until V_{OUT} falls below the over-voltage (OV) threshold of the set VID value. Figure 7-21 shows two cases that differ from each other as to whether V_{OUT} has reached the target voltage corresponding to a new VID when the VR is commanded to slew back up to a higher voltage. In case that V_{OUT} has not decayed down below VID as denoted case 2, the VR waits for VID to catch up, and then V_{OUT} starts ramping up to keep up with the VID ramp.

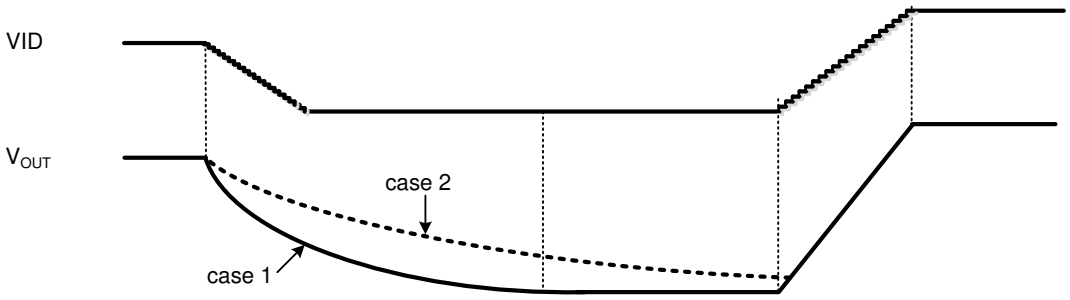

Figure 7-21. Decay Down to a Lower V_{OUT} and Slew Up

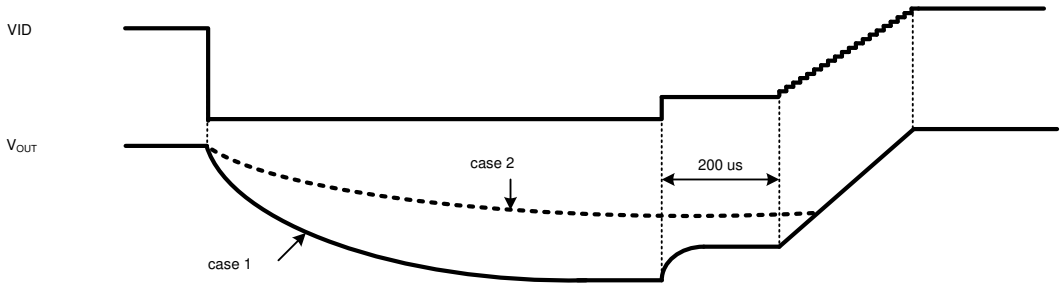

Figure 7-22. Decay Down to 0 V and Slew Up

7.7.5 Current Limit

The buck controllers (BUCK1, BUCK2, and BUCK6) have inductor-valley current-limit architecture and the current limit is programmable by an external resistor at the ILIMx pin. Equation 1 shows the calculation for a desired resistor value, depending on specific application conditions. I_{LIMREF} is the current source out of the ILIMx pin that is typically 50µA, and R_{DSON} is the maximum channel resistance of the low-side FET. The scaling factor is 1.3 to take into account all errors and temperature variations of R_{DSON}, I_{LIMREF}, and R_{ILIM}. Finally, 8 is another scaling factor associated with I_{LIMREF}.

$$R_{ILIM} = \frac{R_{DSON} \times 8 \times 1.3 \times \left(I_{LIM} - \frac{I_{ripple(min)}}{2} \right)}{I_{LIMREF}} \quad (1)$$

where

- I_{LIM} is the target current limit. An appropriate margin must be allowed when determining I_{LIM} from maximum output DC load current.
- $I_{ripple(min)}$ is the minimum peak-to-peak inductor ripple current for a given V_{OUT}.

$$I_{ripple(min)} = \frac{V_{OUT} \left(V_{IN(MIN)} - V_{OUT} \right)}{L_{max} \times V_{IN(MIN)} \times f_{sw(max)}} \quad (2)$$

where

- L_{max} is maximum inductance
- $f_{sw(max)}$ is maximum switching frequency
- $V_{IN(MIN)}$ minimum input voltage to the external power stage

The buck converter limit inductor peak current cycle-by-cycle to I_{IND_LIM} is specified in Section 6.8.

The current limit circuit also protects against reverse current going back into the low side FET from the load. When operating in Force PWM mode, the inductor current is expected to go negative so it is important to ensure that the R_{ILIM} value is sufficient to account for this. If operating in PFM, this can be neglected. The equation for Force PWM minimum R_{ILIM} value is:

$$R_{ILIM} \geq \frac{R_{DSON} \times 8 \times 1.3 \times \left(\frac{I_{ripple(max)}}{2} \right)}{I_{LIMREF}} \quad (3)$$

where

- $I_{ripple(max)}$ is the maximum peak-to-peak inductor ripple current for a given V_{OUT}.

$$I_{ripple(max)} = \frac{V_{OUT} \left(V_{IN(MAX)} - V_{OUT} \right)}{L_{min} \times V_{IN(MAX)} \times f_{sw(min)}} \quad (4)$$

where

- L_{min} is minimum inductance
- $f_{sw(min)}$ is minimum switching frequency
- $V_{IN(MAX)}$ maximum input voltage to the external power stage

If R_{ILIM} is too low for the chosen inductor and voltage conditions, then the ripple current at no load triggers the negative current limit, forcing the low side FET to turn off. The irregular duty cycle created by the current limit triggering results in the output voltage increasing above target regulation point.

7.8 LDOs and Load Switches

7.8.1 VTT LDO

Typically powered from the BUCK6 output, the VTT LDO tracks FBVOUT6 and regulates the output to FBVOUT6 / 2. The LDO current limit is OTP dependent, and it is designed specifically to power DDR memory. The LDO core is a transconductance amplifier with large gain, and it drives a current output stage that either sources or sinks current depending on the deviation of the VTTFB pin voltage from the target regulation voltage.

7.8.2 LDOA1–LDOA3

The TPS650864 device integrates three general purpose LDOs. LDOA1 is powered from a 5-V supply through the DRV5V_2_A1 pin and it can be factory configured to be an Always-On rail (stay on even in case of emergency shutdown) as long as a valid power supply is available at VSYS. See Table 7-24 for LDOA1 output voltage options. LDOA2 and LDOA3 share a power input pin (PVINLDOA2_A3). The output regulation voltages are set by writing to LDOAx_VID[3:0] bits (Reg 0x9A, 0x9B, and 0xAE). See Table 7-25 for LDOA2 and LDOA3 output voltage options. LDOA1 is controlled by the LDOA1_SWB2_CTRL register.

Table 7-24. LDOA1 Output Voltage Options

VID BITS	V_{OUT}	VID BITS	V_{OUT}	VID BITS	V_{OUT}	VID BITS	V_{OUT}
0000	1.35	0100	1.8	1000	2.3	1100	2.85
0001	1.5	0101	1.9	1001	2.4	1101	3.0
0010	1.6	0110	2.0	1010	2.5	1110	3.3
0011	1.7	0111	2.1	1011	2.6	1111	Not Used

Table 7-25. LDOA2 and LDOA3 Output Voltage Options

VID BITS	V_{OUT}	VID BITS	V_{OUT}	VID BITS	V_{OUT}	VID BITS	V_{OUT}
0000	0.70	0100	0.90	1000	1.10	1100	1.30
0001	0.75	0101	0.95	1001	1.15	1101	1.35
0010	0.80	0110	1.00	1010	1.20	1110	1.40
0011	0.85	0111	1.05	1011	1.25	1111	1.50

7.8.3 Load Switches

The PMIC features three general-purpose load switches. SWA1 has its own power input pin (PVINSWA1), while SWB1 and SWB2 share one power input pin (PVINSWB1_B2). All switches have built-in slew rate control during start-up to limit the inrush current.

7.9 Power Goods (PGOOD or PG) and GPOs

The device provides information on status of VRs through four GPO pins along with Power Good Status registers defined in Section 7.13.50 and Section 7.13.51. Power Good information of any individual VR and load switch can be assigned to be part of the PGOOD tree as defined from Section 7.13.40 to Section 7.13.47. PGOOD assertion delays are programmable from 0 ms to 15 ms for GPO1, 5 ms to 100 ms for GPO3, and 0 ms to 100 ms for GPO2 and GPO4, respectively, as are defined in Section 7.13.21 and Section 7.13.34.

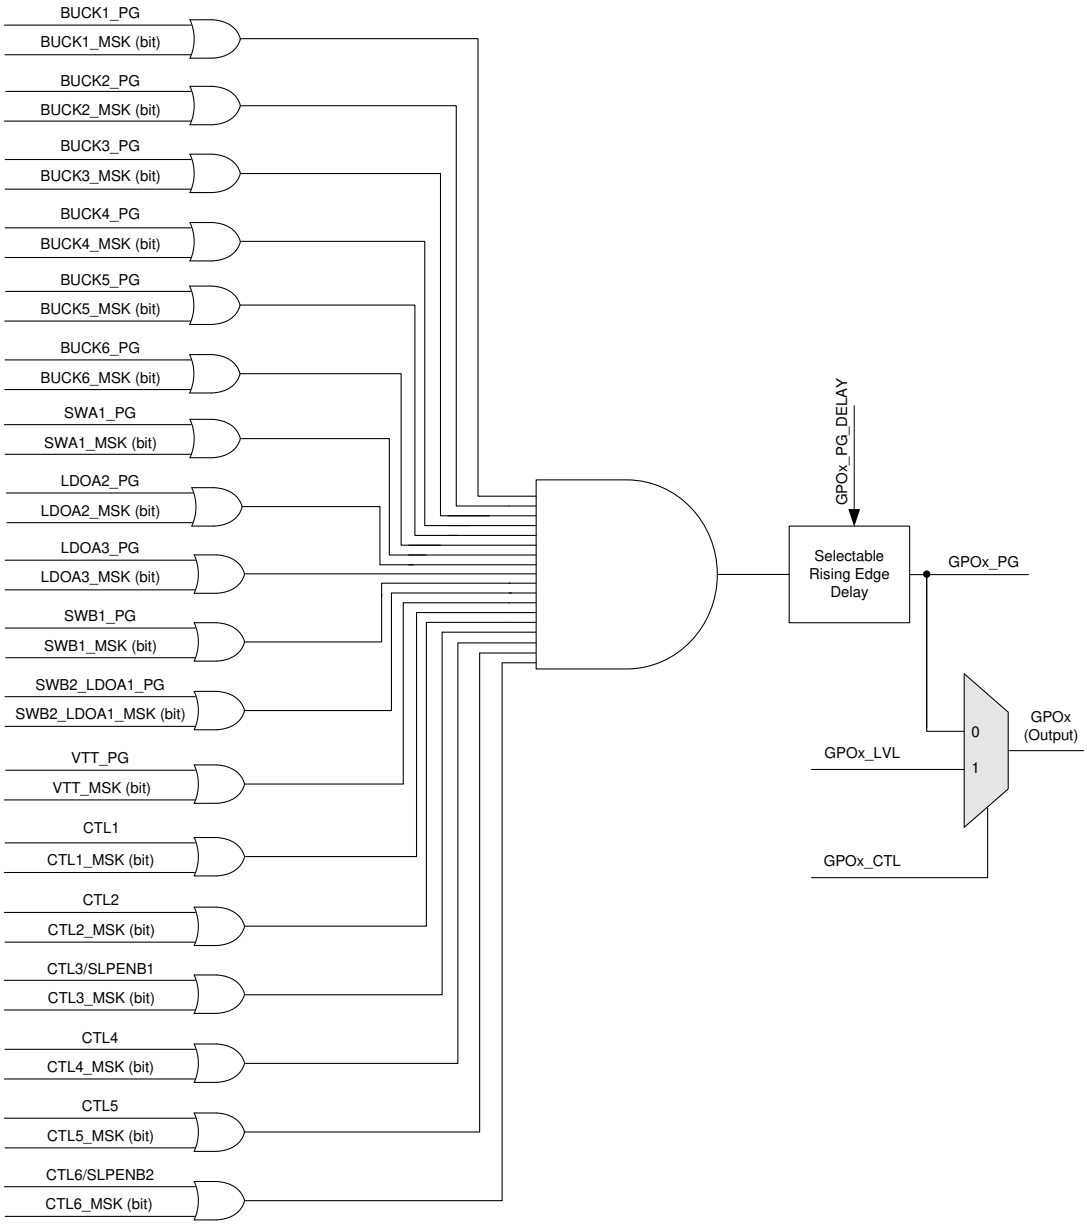

Figure 7-23. Power Good Tree

Alternatively, the GPOs can be used as general purpose outputs controlled by the user through I^2C. Refer to Section 7.13.37 for details on controlling the GPOs in I^2C control mode. When configured as push-pull, LDO3P3 is used for logic-level high.

7.10 Power Sequencing and VR Control

The device has three different ways of sequencing the rails during power up and power down:

- Rail enabled by CTLx pin
- Rail enabled by Power Good (PG) of previously enabled rail
- Rail enabled by I^2C software command

A delay can be added from any CTLx pin or PG to the enable of the subjected enabled rail. The configurable delay creates a very flexible device capable of many sequence options. If a rail cannot be sequenced automatically, any rail can be enabled or disabled through an I^2C command.

7.10.1 CTLx Sequencing

The device has six control-input pins (CTL1–CTL6) to control six SMPS regulators, three LDO regulators, and three load switches. The control-input pins allow the user to define up to six distinctive groups, to which each VR can be assigned for highly flexible power sequencing. Of the six CTLx pins, CTL3 and CTL6 can be configured alternatively to active-low sleep enable pins. For instance, if a system level SLEEP state is defined such that BUCK1 output regulation voltage is lower than in the normal mode, then BUCK1 SLEEP state can be assigned to CTL3 or CTL6. By being pulled low, either CTL3 or CTL6 can be used to put BUCK1 into SLEEP state, and BUCK1 regulates its output at a voltage defined by BUCK1_SLP_VID[6:0] in Section 7.13.23. For a demonstration of this feature, Figure 7-24 shows how BUCK1 is enabled from the CTL1 pin.

7.10.2 PG Sequencing

Any rail can be sequenced by the Power Good of a prior rail. The PG method can be combined with the CTLx method to allow for further sequence control and create more distinctive groups of enables than the six from CTLx. Using a combination of the methods also allows some of the CTLx pins to be freed up for other purposes such as logic input gates. For a demonstration of this feature, Figure 7-24 shows how the BUCK5 is enabled from the BUCK4 PG.

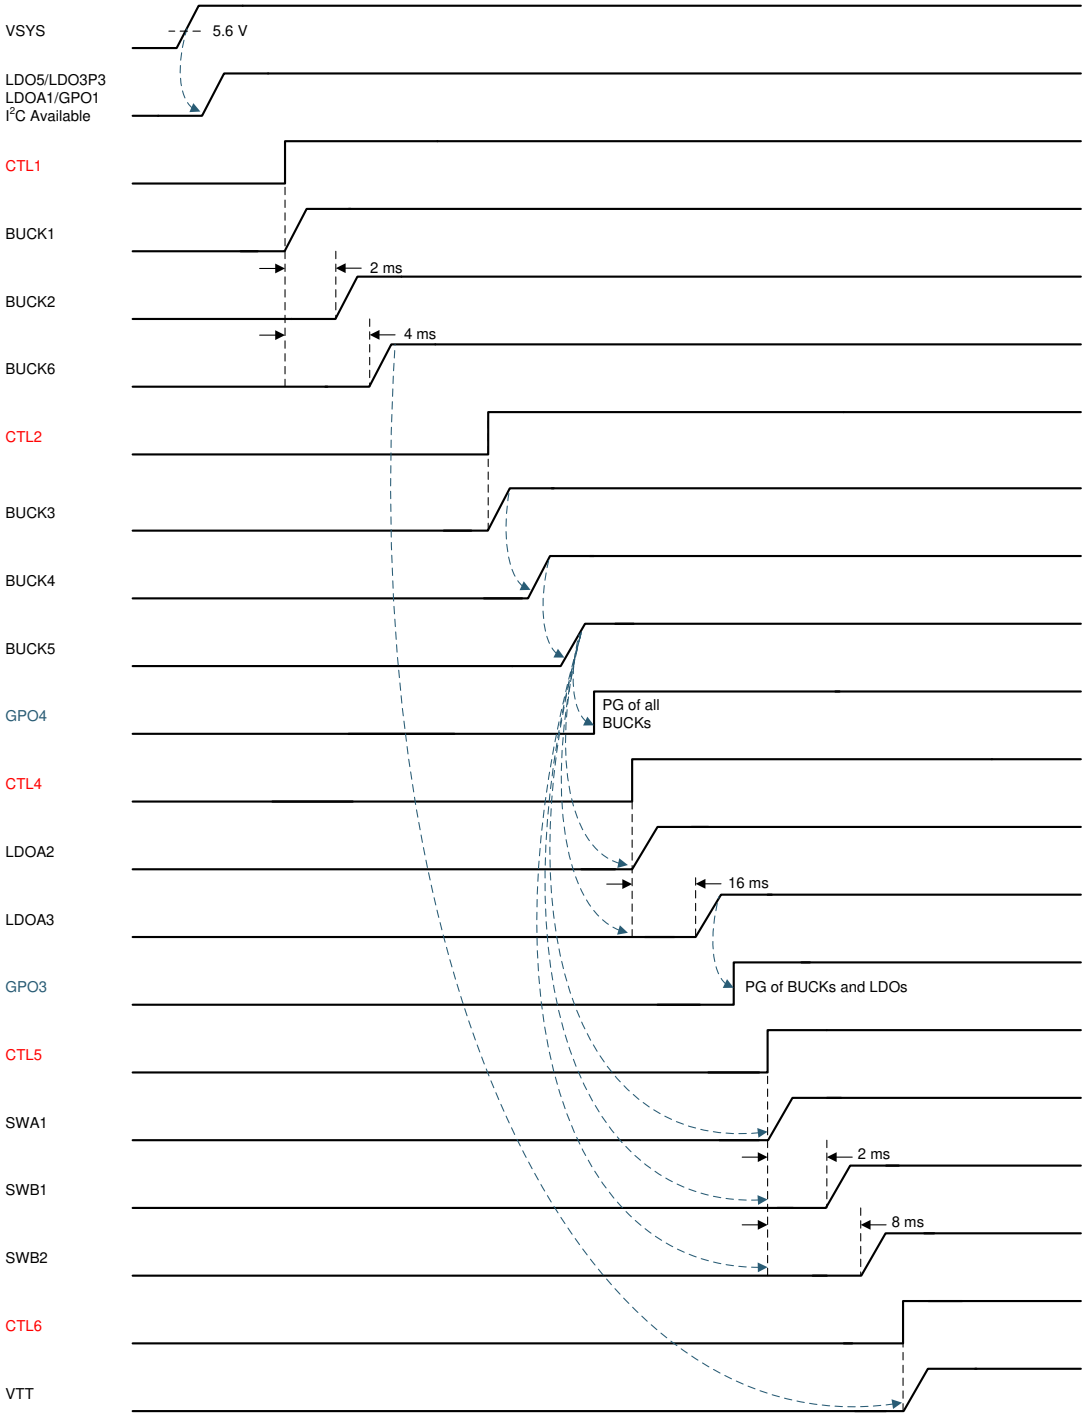

Figure 7-24. Generic Power-Up Sequence Example

7.10.3 Enable Delay

A delay can be added to the enable of any rail after the desired CTLx and PGs are met. Adding a delay allows for the option to create additional timing groups from either CTLx pins or internal PGs. For a demonstration of this feature, Figure 7-24 shows how BUCK2 and BUCK6 are enabled after BUCK1 is enabled from CTL1 pin.

7.10.4 Power-Up Sequence

When a valid power supply is detected at the VSYS pin as V_{SYS} crosses above $V_{SYS\_UVLO\_5V}$ + $V_{SYS\_UVLO+5V\_HYS}$, the power-up sequence is initiated by driving one of the control input pins high, followed by the rest of pins in order. Figure 7-24 is an example where CTL1–CTL4 are defined to control four groups of VRs, while GPO3 and GPO4 are defined to provide a PGOOD status of two groups. The control input pins do not necessarily have to be pulled up in a staggered manner. For instance, if CTL2 is pulled up from the preceding group of VRs before PGOOD has been asserted at GPO1, the BUCK4 enable is delayed until the PGOOD is asserted.

For the specific sequencing of a TPS650864 device, see Table 4-1.

7.10.5 Power-Down Sequence

The power-down sequence can follow the CTLx pins, or be controlled with the I^2C commands. If the internal PGs are used for sequencing or if some rails need to ramp down before others a delay can be added to the deassertion low of the internal enable of the subjected rail. This delay can be independent of the power-up delay option. Thus, power-up and power-down sequences can be different or similar to match the specific application sequences required.

Refer to Figure 7-25 for an example of a power-down sequence demonstrating the delay disable of BUCK1 and BUCK2.

For the specific sequencing of a TPS650864 device, see Table 4-1.

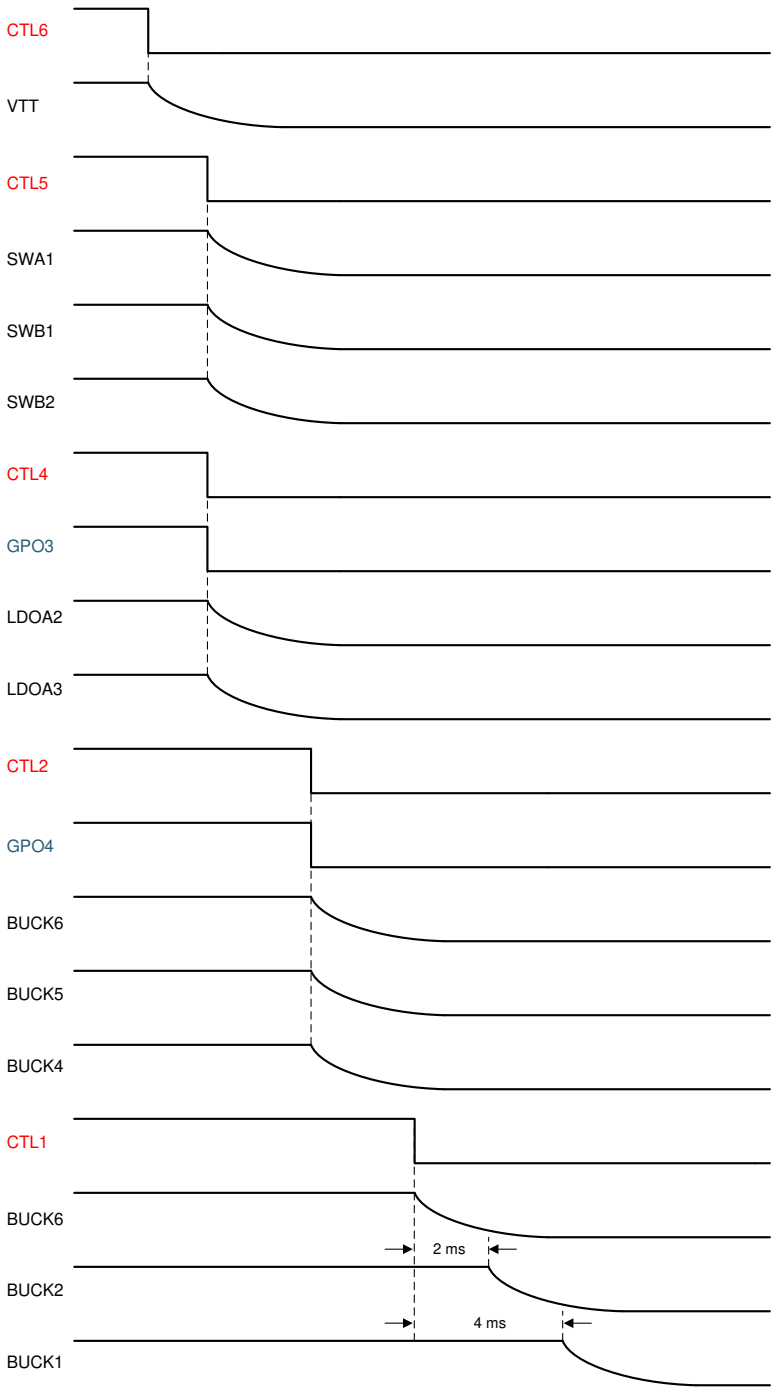

Figure 7-25. Generic Power-Down Sequence Example

7.10.6 Sleep State Entry and Exit

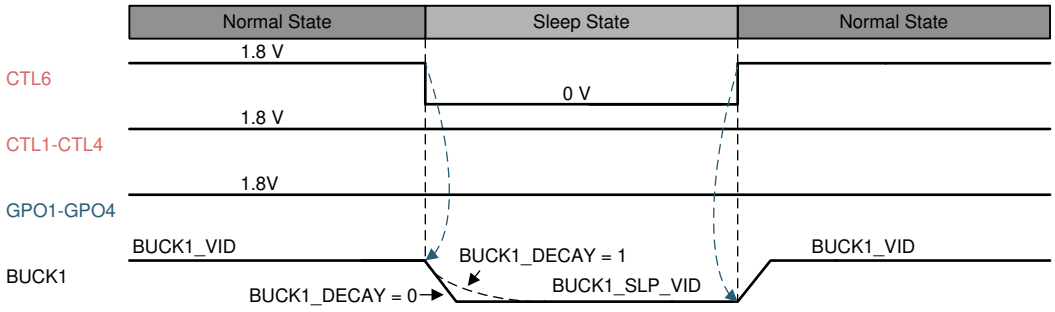

Figure 7-26. Sleep State Entry and Exit Sequence Example

Figure 7-26 shows an example where BUCK1 is defined to enter Sleep State in response to CTL6 going low.

Note

All PGOODs from GPO1–GPO4 can stay asserted during the entry and the exit. Depending on status of the BUCK1_DECAY bit defined in the BUCK1CTRL register, BUCK1 output either decays or slews down to a new voltage defined in BUCK1_SLP_VID[6:0].

7.10.7 Emergency Shutdown

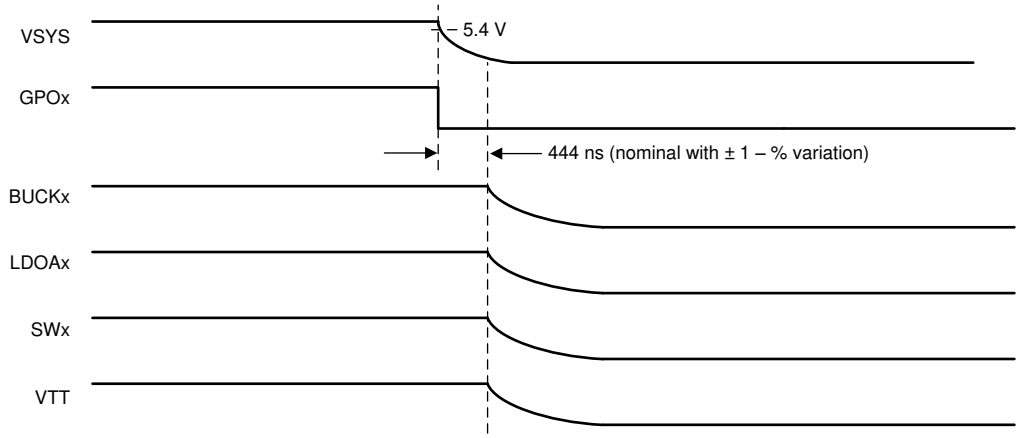

Figure 7-27. Emergency Shutdown Sequence

When V_{SYS} crosses below $V_{SYS\_UVLO\_5V}$, all Power Good pins are deasserted, and after 444ns (nominal) of delay all VRs shut down. Upon shutdown, all internal discharge resistors are set to 100Ω to ensure timely decay of all VR outputs. Other conditions that cause emergency shutdown are the die temperature rising above the critical temperature threshold (T_{CRIT}), deassertion of Power Good of any rail (configurable), or failure of any rail to reach power good within 10ms of being enabled (configurable). If the PMIC was shutdown by UVLO, it waits until VSYS rises above $V_{SYS\_UVLO\_5V}$ + $V_{SYS\_UVLO\_5V\_HYS}$ before reloading the default OTP and checking the state of the CTLx pins. If the PMIC was shutdown by temperature, it waits until temperature drops below T_{CRIT} – T_{CRIT_HYS} before reloading the OTP and checking the state of the CTLx pins. If the PMIC was shutdown by power fault, it reloads the OTP after disabling all rails and check the state of the CTLx pins once the OTP has finished reloading.

7.11 Device Functional Modes

7.11.1 Off Mode

When power supply at the VSYS pin is less than $V_{SYS\_UVLO\_5V}$ (5.4V nominal) + $V_{SYS\_UVLO\_5V\_HYS}$ (0.2V nominal), the device is in off mode, where all output rails are disabled. If the supply voltage is greater than $V_{SYS\_UVLO\_3V}$ (3.6V nominal) + $V_{SYS\_UVLO\_3V\_HYS}$ (0.15V nominal) while it is still less than $V_{SYS\_UVLO\_5V}$ + $V_{SYS\_UVLO\_5V\_HYS}$, then the internal band-gap reference (VREF pin) along with LDO3P3 are enabled and regulated at target values.

7.11.2 Standby Mode

When power supply at the VSYS pin rises above $V_{SYS\_UVLO\_5V}$ + $V_{SYS\_UVLO\_5V\_HYS}$, the device enters standby mode, where all internal reference and regulators (LDO3P3 and LDO5) are up and running, and I^2C interface and CTL pins are ready to respond. All default registers defined in Section 7.13 are loaded from one-time programmable (OTP) memory. Quiescent current consumption in standby mode is specified in Section 6.5.

7.11.3 Active Mode

The device proceeds to active mode when any output rail is enabled either through an input pin as discussed in Section 7.10 or by writing to EN bits through I^2C. Output regulation voltage can also be changed by writing to VID bits defined in Section 7.13.

7.12 I^2C Interface

The I^2C interface is a 2-wire serial interface developed by NXP™ (formerly Philips Semiconductor) (see I^2C-Bus Specification and user manual, Rev 4, 13 February 2012). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I^2C compatible devices connect to the I^2C bus through open drain I/O pins, DATA and CLK. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device.

The PMIC works as a slave and supports the following data transfer modes, as defined in the I^2C-Bus Specification: standard mode (100 kbps), fast mode (400 kbps), and high-speed mode (1 Mbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents are loaded when V_{SYS} higher than $V_{SYS\_UVLO\_5V}$ is applied to the PMIC. The I^2C interface is running from an internal oscillator that is automatically enabled when there is an access to the interface.

The data transfer protocol for standard and fast modes are exactly the same, therefore, they are referred to as F/S-mode in this document. The protocol for high-speed mode is different from the F/S-mode, and it is referred to as H/S-mode.

The PMIC device supports 7-bit addressing; however, 10-bit addressing and general call address are not supported. The default device address is 0x5E.

7.12.1 F/S-Mode Protocol

The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high (see Figure 7-28). All I²C-compatible devices recognize a start condition.

The master then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 7-29). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an acknowledge (see Figure 7-30), by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the master knows that the communication link with a slave has been established.

The master generates further SCL cycles to either transmit data to the slave (R/W bit = 0) or receive data from the slave (R/W bit = 1). In either case, the receiver needs to acknowledge the data sent by the transmitter. An acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see Figure 7-28). The stop condition releases the bus and stops the communication link with the addressed slave. All I²C-compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a start condition followed by a matching address.

7.13 Register Maps

7.13.1 Register Map Summary

Do not attempt to write a RESERVED R/W bit to the opposite value. When the reset value of a bit register is 0bX, it means the bit value is coming from the OTP memory.

Table 7-26. Register Map Summary

Address	Name	Short Description
00h	DEVICEID1	Device ID code indicating revision
01h	DEVICEID2	Device ID code indicating revision
02h	IRQ	Interrupt statuses
03h	IRQ_MASK	Interrupt masking
04h	PMIC_STAT	PMIC temperature indicator
05h	SHUTDNSRC	Shutdown root cause indicator bits
20h	BUCK1CTRL	BUCK1 decay control and voltage select
21h	BUCK2CTRL	BUCK2 decay control and voltage select
22h	BUCK3DECAY	BUCK3 decay control
23h	BUCK3VID	BUCK3 voltage select
24h	BUCK3SLPCTRL	BUCK3 voltage select for sleep state
25h	BUCK4CTRL	BUCK4 control
26h	BUCK5CTRL	BUCK5 control
27h	BUCK6CTRL	BUCK6 control
28h	LDOA2CTRL	LDOA2 control
29h	LDOA3CTRL	LDOA3 control
40h	DISCHCTRL1	Discharge resistors for each rail control
41h	DISCHCTRL2	Discharge resistors for each rail control
42h	DISCHCTRL3	Discharge resistors for each rail control
43h	PG_DELAY1	System Power Good on GPO3 (*if GPO3 is programmed to be system PG*)
91h	FORCESHUTDN	Software force shutdown
92h	BUCK1SLPCTRL	BUCK1 voltage select for sleep state
93h	BUCK2SLPCTRL	BUCK2 voltage select for sleep state
94h	BUCK4VID	BUCK4 voltage select
95h	BUCK4SLPVID	BUCK4 voltage select for sleep state
96h	BUCK5VID	BUCK5 voltage select
97h	BUCK5SLPVID	BUCK5 voltage select for sleep state
98h	BUCK6VID	BUCK6 voltage select
99h	BUCK6SLPVID	BUCK6 voltage select for sleep state
9Ah	LDOA2VID	LDOA2 voltage select
9Bh	LDOA3VID	LDOA3 voltage select
9Ch	BUCK123CTRL	BUCK1, 2, and 3 disable and PFM/PWM mode control
9Dh	PG_DELAY2	System Power Good on GPO1, 2, and 4 (*if GPOs are programmed to be system PG*)
9Fh	SWVTT_DIS	SWs and VTT I^2C disable bits
A0h	I2C_RAIL_EN1	I^2C Enable control of individual rails
A1h	I2C_RAIL_EN2/GPOCTRL	I^2C Enable control of individual rails and I^2C controlled GPOs, high or low
A2h	PWR_FAULT_MASK1	Power fault masking for individual rails
A3h	PWR_FAULT_MASK2	Power fault masking for individual rails
A4h	GPO1PG_CTRL1	Power good tree control for GPO1
A5h	GPO1PG_CTRL2	Power good tree control for GPO1

Table 7-26. Register Map Summary (continued)

Address	Name	Short Description
A6h	GPO4PG_CTRL1	Power good tree control for GPO4
A7h	GPO4PG_CTRL2	Power good tree control for GPO4
A8h	GPO2PG_CTRL1	Power good tree control for GPO2
A9h	GPO2PG_CTRL2	Power good tree control for GPO2
AAh	GPO3PG_CTRL1	Power good tree control for GPO3
ABh	GPO3PG_CTRL2	Power good tree control for GPO3
ACh	MISCSYSPG	Power good tree control with CTL3 and CTL6 for GPO
ADh	VTT_DISCH_CTRL	Discharge resistor setting for VTT LDO
AEh	LDOA1_SWB2_CTRL	LDOA1 and SWB2 control for discharge, voltage selection, and enable
B0h	PG_STATUS1	Power good statuses for individual rails
B1h	PG_STATUS2	Power good statuses for individual rails
B2h	PWR_FAULT_STATUS1	Power fault statuses for individual rails
B3h	PWR_FAULT_STATUS2	Power fault statuses for individual rails
B4h	TEMPCRIT	Critical temperature indicators
B5h	TEMPHOT	Hot temperature indicators

Complex bit access types are encoded to fit into small table cells. Table 7-27 shows the codes that are used for access types in this section.

Table 7-27. Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

7.13.2 DEVICEID1: 1st PMIC Device and Revision ID Register (offset = 00h) [reset = X]

Figure 7-34. DEVICEID1 Register

Access	R/W	R	R	R	R/W	R	R	R/W

Table 7-30. IRQ Register Descriptions

Bit	Field	Type	Reset	Description
7	FAULT	R/W	0	Fault interrupt. Asserted when either condition occurs: power fault of any rail, or die temperature crosses over the critical temperature threshold (T_{CRIT}). The user can read ***Reg. 0xB2–0xB6*** to determine what has caused the interrupt. **0**: Not asserted **1**: Asserted. Host to write 1b to clear.
3	SHUTDN	R/W	0	Asserted when PMIC shuts down. To clear indicator, SHUTDNSRC must be cleared first, see Section 7.13.7 **0**: Not asserted. **1**: Asserted. Host to write 1b to clear.
0	DIETEMP	R/W	0	Die temp interrupt. Asserted when PMIC die temperature crosses above the hot temperature threshold (T_{HOT}). **0**: Not asserted. **1**: Asserted. Host to write 1b to clear.

7.13.5 IRQ_MASK: PMIC Interrupt Mask Register (offset = 03h) [reset = 1111 1111]

Figure 7-37. IRQ_MASK Register

Bit	7	6	5	4	3	2	1	0

TPS650864	1	1	1	1	1	1	1	1
Access	R/W	R	R	R	R/W	R	R	R/W

Table 7-31. IRQ_MASK Register Descriptions

Bit	Field	Type	Reset	Description
7	MFAULT	R/W	1	FAULT interrupt mask. **0**: Not masked. **1**: Masked.
3	msHUTDN	R/W	1	PMIC shutdown event interrupt mask **0**: Not masked. **1**: Masked.
0	MDIETEMP	R/W	1	Die temp interrupt mask. **0**: Not masked. **1**: Masked.

7.13.6 PMICSTAT: PMIC Status Register (offset = 04h) [reset = 0000 0000]

Figure 7-38. PMICSTAT Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	SDIETEMP
TPS650864	0	0	0	0	0	0	0	0
Access	R	R	R	R	R	R	R	R

Table 7-32. PMICSTAT Register Descriptions

Bit	Field	Type	Reset	Description
0	SDIETEMP	R	0	PMIC die temperature status. **0**: PMIC die temperature is below T_{HOT}. **1**: PMIC die temperature is above T_{HOT}.

7.13.7 SHUTDNSRC: PMIC Shut-Down Event Register (offset = 05h) [reset = 0000 0000]

Figure 7-39. SHUTDNSRC Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	RESERVED	RESERVED	COLDOFF	UVLO	PWR_FAULT	CRITTEMP
TPS650864	0	0	0	0	0	0	0	0
Access	R	R	R	R	R/W	R/W	R/W	R/W

Table 7-33. SHUTDNSRC Register Descriptions

Bit	Field	Type	Reset	Description
3	COLDOFF	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. **0**: Cleared **1**: N/A. Not enabled for existing OTPs.
2	UVLO	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. **0**: Cleared **1**: PMIC was shut down due to a UVLO event (V_{SYS} crosses below 5.4 V). Assertion of this bit sets the SHUTDN bit in Section 7.13.4.
1	PWR_FAULT	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. **0**: Cleared **1**: PMIC was shut down due to an unmasked power fault event. Assertion of this bit sets the SHUTDN bit in Section 7.13.4. The source of the power fault can be determined from the PWR_FAULT registers (0xB2 and 0xB3). Overcurrent protection limits I_{OUT} and typically causes power fault as V_{OUT} droops.
0	CRITTEMP	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. **0**: Cleared **1**: PMIC was shut down due to the rise of PMIC die temperature above critical temperature threshold (T_{CRIT}). Assertion of this bit sets the SHUTDN bit in Section 7.13.4.

7.13.8 BUCK1CTRL: BUCK1 Control Register (offset = 20h) [reset = X]

Figure 7-40. BUCK1CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	BUCK1_ VID[6]	BUCK1_ VID[5]	BUCK1_ VID[4]	BUCK1_ VID[3]	BUCK1_ VID[2]	BUCK1_ VID[1]	BUCK1_ VID[0]	BUCK1_ DECAY

Table 7-61. SWVTT_DIS Register Descriptions

Bit	Field	Type	Reset	Description
7	SWB2_LDOA1_DIS	R/W	X	SWB2 or LDOA1 Disable Bit. Writing 0 to this bit forces SWB2 or LDOA1 to turn off regardless of any control input pin (CTL1–CTL6) status. OTP setting selects either SWB2 or LDOA1. **0**: Disable. **1**: Enable. SWB2 for: TPS65086470 LDOA1 for: TPS6508640, TPS65086401, and TPS6508641
6	SWB1_DIS	R/W	X	SWB1 Disable Bit. Writing 0 to this bit forces SWB1 to turn off regardless of any control input pin (CTL1–CTL6) status. **0**: Disable. **1**: Enable.
5	SWA1_DIS	R/W	X	SWA1 Disable Bit. Writing 0 to this bit forces SWA1 to turn off regardless of any control input pin (CTL1–CTL6) status. **0**: Disable. **1**: Enable.
4	VTT_DIS	R/W	X	VTT Disable Bit. Writing 0 to this bit forces VTT to turn off regardless of any control input pin (CTL1–CTL6) status. **0**: Disable. **1**: Enable.
3:0	Reserved	R/W	0000	Reserved bits. Always write to 0000.

8 Applications, Implementation, and Layout

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The TPS650864 for Xilinx MPSoCs and FPGAs can be used in a variety of ways which is outlined in the following sections. Section 8.2 discusses the design procedure for the general case. Specific OTP information can be found starting with Section 7.6. In general, the PMIC is controlled by the state of the six CTL which can accept up to 3.6 V inputs. How these control pins are set varies based on application. Some examples would be using the PG of external rails, looping GPOs back into CTL pins, connecting a locking push-button, using a push-button circuit, using an embedded controller (such as the msP430G2121), or controlled by the MPSoC itself.

8.2 Typical Application

This section describes the general application information and provides a more detailed description on the PMIC that powers a generic multicore-processor application. An example system block diagram for the device powering an SoC and the rest of platform is shown in Figure 8-1. The functional block diagram in Figure 7-1 outlines the typical external components necessary for proper device functionality.

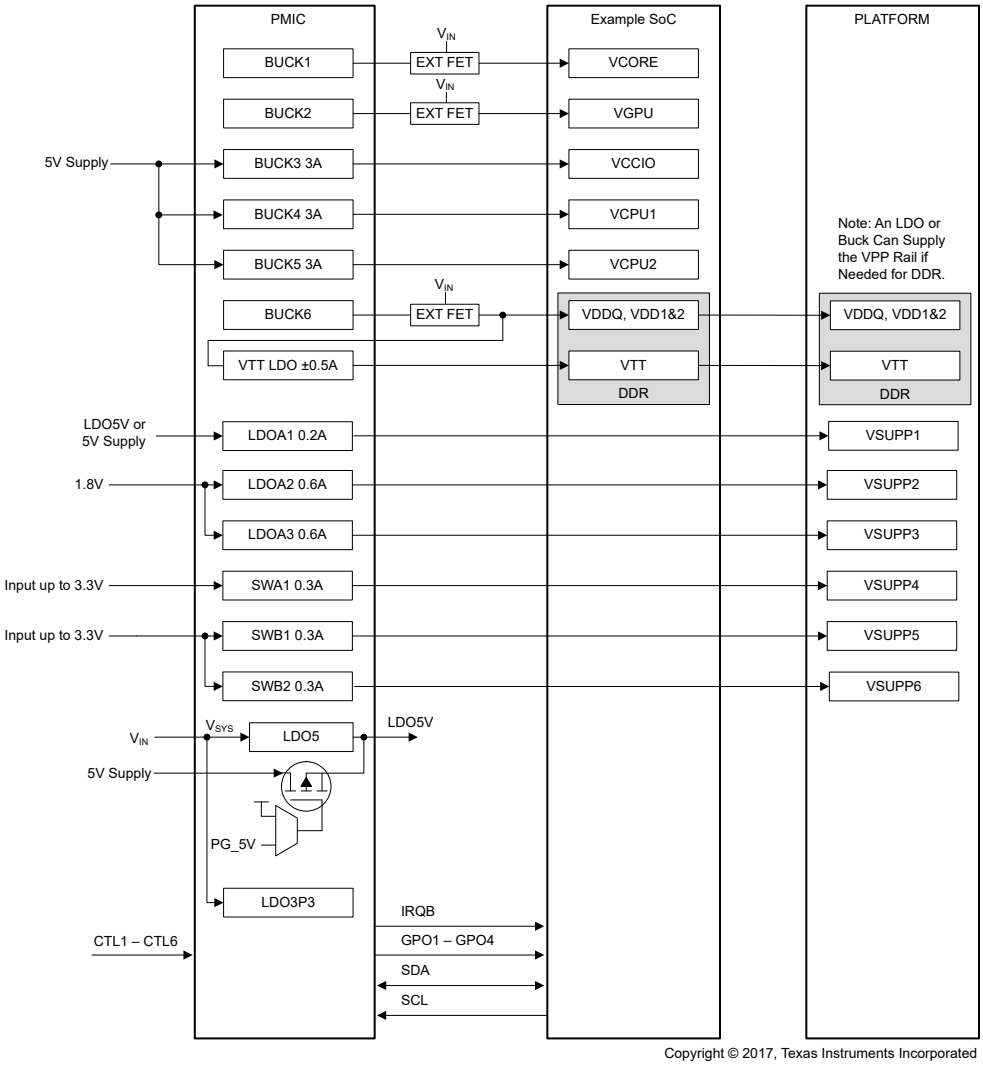

Figure 8-1. Typical Application Example

8.2.1 Design Requirements

The PMIC requires decoupling caps on the supply pins. Follow the values for recommended capacitance on these supplies given in *Section 6*. The controllers, converter, LDOs, and some other features can be adjusted to meet specific application needs. Section 8.2.2 describes how to design and adjust the external components to achieve desired performance.

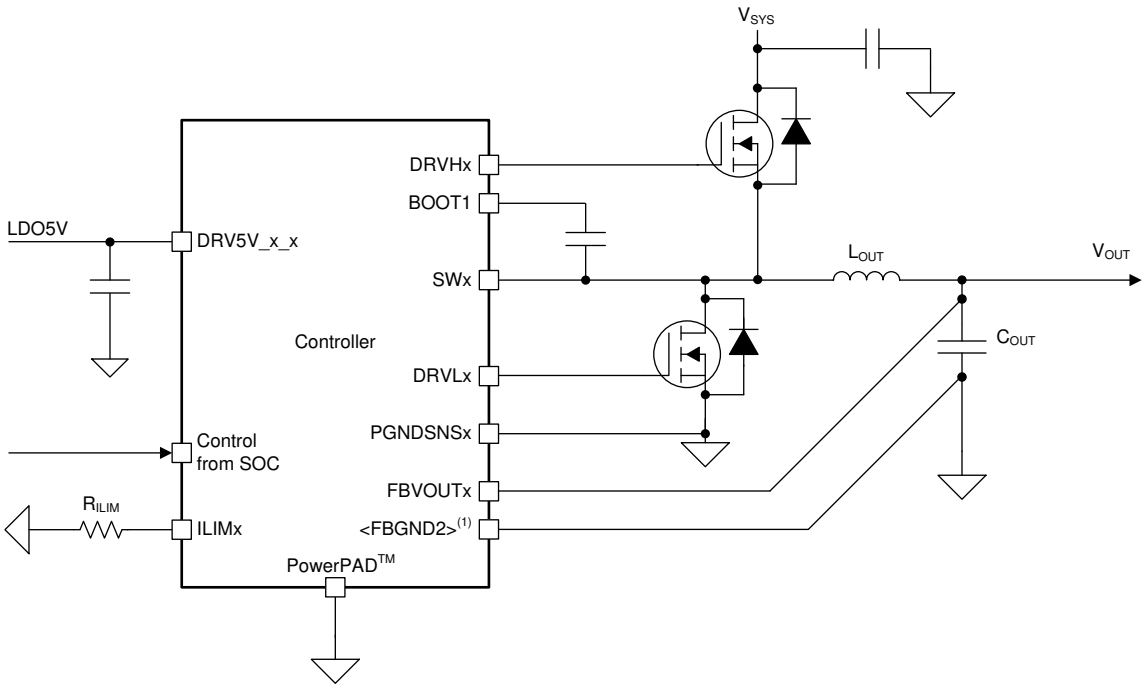
8.2.2 Detailed Design Procedure

8.2.2.1 Controller Design Procedure

Designing the controller can be broken down into the following steps:

1. Design the output filter.
2. Select the FETs.
3. Select the bootstrap capacitor.
4. Select the input capacitors.
5. Set the current limits.

Controllers BUCK1, BUCK2, and BUCK6 require a 5-V supply and capacitors at their corresponding DRV5V_x_x pins. For most applications, the DRV5V_x_x input comes from the LDO5P0 pin to ensure uninterrupted supply voltage; a 2.2 µF, X5R, 20%, 10 V, or similar capacitor must be used for decoupling.



A. <FBGND2> is only present for BUCK2.

Figure 8-2. Controller Diagram

8.2.2.1.1 Selecting the Inductor

Placement of an inductor is required between the external FETs and the output capacitors. Together, the inductor and output capacitors make the double-pole that contributes to stability. In addition, the inductor is directly responsible for the output ripple, efficiency, and transient performance. As the inductance used increases, the ripple current decreases, which typically results in an increased efficiency. However, with an increase in inductance used, the transient performance decreases. Finally, the inductor selected must be rated for appropriate saturation current, core losses, and DC resistance (DCR).

Equation 5 shows the calculation for the recommended inductance for the controller.

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times f_{sw} \times I_{OUT(MAX)} \times K_{IND}} \quad (5)$$

where

- V_{OUT} is the typical output voltage
- V_{IN} is the typical input voltage
- f_{SW} is the typical switching frequency when loaded, 1 MHz unless otherwise noted
- $I_{OUT(MAX)}$ is the maximum load current
- K_{IND} is the ratio of $I_{Lripple}$ to the $I_{OUT(MAX)}$. For this application, TI recommends that K_{IND} is set to a value from 0.2 to 0.4. Higher values have improved transient performance, lower values have improved efficiency

With the chosen inductance value, the peak current for the inductor in steady state operation, $I_{L(max)}$, can be calculated using Equation 6. The rated saturation current of the inductor must be higher than the $I_{L(max)}$ current.

$$I_{L(MAX)} = I_{OUT(MAX)} + \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{2 \times V_{IN} \times f_{sw} \times L} \quad (6)$$

8.2.2.1.2 Selecting the Output Capacitors

TI recommends using ceramic capacitors with low ESR values to provide the lowest output voltage ripple. The output capacitor requires an X7R or an X5R dielectric. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance over temperature, become resistive at high frequencies.

At light load currents, the controller operates in PFM mode, and the output voltage ripple is dependent on the output-capacitor value and the PFM peak inductor current. Higher output-capacitor values minimize the voltage ripple in PFM mode. To achieve specified regulation performance and low output voltage ripple, the DC-bias characteristic of ceramic capacitors must be considered. The effective capacitance of ceramic capacitors drops with increasing DC bias voltage.

TI recommends the use of small ceramic capacitors placed between the inductor and load with many vias to the PGND plane for the output capacitors of the BUCK controllers. This solution typically provides the smallest and lowest cost solution available for D-CAP2 controllers.

The selection of the output capacitor is typically driven by the output transient response. Equation 7 and Equation 8 provide a rough estimate of the minimum required capacitance to ensure proper transient response. Because the transient response is significantly affected by the board layout, some experimentation is expected in order to confirm that values derived in this section are applicable to any particular use case. These are not meant to be an absolute requirement, but rather a rough starting point. Alternatively, some known combination values from which to begin are provided in Table 8-1. V_{UNDER} and V_{OVER} values must be greater than or equal to 3% of V_{OUT} setting in order for equations to be meaningful. The equations provide some margin so that actual capacitance requirement may be lower than calculated.

$$C_{OUT} > \frac{I_{TRAN(MAX)}^{2} \times L}{(V_{IN} - V_{OUT}) \times V_{UNDER}} \quad (7)$$

where

- $I_{TRAN(max)}$ is the maximum load current step
- L is the chosen inductance
- V_{IN} is the maximum input voltage
- V_{OUT} is the minimum programmed output voltage
- V_{UNDER} is the maximum allowable undershoot from programmed voltage

$$C_{OUT} > \frac{I_{TRAN(MAX)}^{2} \times L}{V_{OUT} \times V_{OVER}} \quad (8)$$

where

- V_{OVER} is the maximum allowable overshoot from programmed voltage

Another key performance factor can be the ripple voltage while in pulsed frequency modulation mode, also known as discontinuous conduction mode. At light load, the controller disables the low side FET once it detects a zero-crossing event on the inductor current. The low side FET stays disabled until V_{OUT} crosses below the set VID threshold. This architecture allows significant power savings at light load conditions by minimizing power loss through the low side FET and through switching. The disadvantage is that there is higher voltage ripple since the ripple current is only positive. Additionally, for even higher efficiency, $T_{ON(PFM)}$ for this device is typically 80% longer than $T_{ON(PWM)}$, which can be calculated by dividing the duty cycle by the switching frequency. An estimate for the required capacitance for a given allowable ripple voltage at light load is shown in Equation 9. ESR of the output capacitor is neglected here because ceramic capacitors, which typically have low ESR, are recommended. V_{OVER} must not be set lower than 3% of V_{OUT} value.

$$C_{OUT} > \frac{T_{ON\_EXT}^{2} \times V_{OUT} \times (V_{IN} - V_{OUT})}{2 \times V_{IN} \times f_{SW}^{2} \times V_{OVER} \times L} \quad (9)$$

where

- T_{ON_EXT} is the PFM on time extension constant, 1.8 unless otherwise noted in the part number specific section
- V_{OUT} is the maximum programmed output voltage
- V_{IN} is the maximum input voltage
- f_{SW} is the typical switching frequency when loaded, 1 MHz unless otherwise noted
- V_{OVER} is the maximum allowable overshoot from programmed voltage
- L is the chosen inductance

In cases where the transient current change is very low and ripple voltage allowance is large, the DC stability may become important. DCAP2 is a very stable architecture so this value is likely to be the smallest of those calculated. Equation 10 approximates the amount of capacitance necessary to maintain DC stability. Again, this is provided as a starting point; actual values vary on a board-to-board case.

$$C_{OUT} > \frac{V_{OUT} \times 50\ \mu s}{V_{IN} \times f_{SW} \times L} \quad (10)$$

where

- V_{OUT} is the maximum programmed output voltage
- 50µs is based on internal ramp setup
- V_{IN} is the minimum input voltage
- f_{SW} is the typical switching frequency
- L is the chosen inductance

Choosing the maximum valuable between Equation 7, Equation 8, Equation 9, and Equation 10 is recommended as a starting point to get the desired performance. All equations are estimates and have not been validated at

all variable corners. Removing excess capacitance or adding extra capacitance may be necessary during board evaluation. Testing can typically be performed on the evaluation module or on prototype boards.

Table 8-1. Known LC Combinations for 1µs Load Rise and Fall Time

$I_{TRAN(max)}$ (A)	L (µH)	V_{OUT} (V)	V_{UNDER} (V)	V_{OVER} (V)	C_{OUT}(µF)
3.5	0.47	1	0.05	0.05	110
4	0.47	1	0.05	0.05	220
5	0.47	1.35	0.068	0.068	220
8	0.33	1	0.05	0.06	440
20	0.22	1	0.05	0.16	550

8.2.2.1.3 Selecting the FETs

This controller is designed to drive two NMOS FETs. Typically, lower R_{DSON} values are better for improving the overall efficiency of the controller, however higher gate charge thresholds result in lower efficiency so the two need to be balanced for optimal performance. As the R_{DSON} for the low-side FET decreases, the minimum current limit increases; therefore, ensure selection of the appropriate values for the FETs, inductor, output capacitors, and current limit resistor. TI's CSD85301Q2, CSD87331Q3D, CSD87381P, CSD87588N, and CSD87350Q5D devices are recommended for the controllers, depending on the required maximum current.

8.2.2.1.4 Bootstrap Capacitor

To ensure the internal high-side gate drivers are supplied with a stable low-noise supply voltage, a capacitor must be connected between the SWx pins and the respective BOOTx pins. TI recommends placing ceramic capacitors with the value of 0.1 µF for the controllers. During testing, a 0.1 µF, size 0402, 10 V capacitor is used for the controllers.

TI recommends reserving a small resistor in series with the bootstrap capacitor in case the turnon and turnoff of the FETs must be slowed to reduce voltage ringing on the switch node, which is a common practice for controller design.

8.2.2.1.5 Setting the Current Limit

The current-limiting resistor value must be chosen based on Equation 1.

8.2.2.1.6 Selecting the Input Capacitors

Due to the nature of the switching controller with a pulsating input current, a low ESR input capacitor is required for best input-voltage filtering and also for minimizing the interference with other circuits caused by high input-voltage spikes. For the controller, a typical 2.2 µF capacitor can be used for the DRV5V_x_x pin to handle the transients on the driver. For the FET input, 10 µF of input capacitance (after derating) is recommended for most applications. To achieve the low ESR requirement, a ceramic capacitor is recommended. However, the voltage rating and DC-bias characteristic of ceramic capacitors must be considered. For better input-voltage filtering, the input capacitor can be increased without any limit.

Note

Use the correct value for the ceramic capacitor capacitance after derating to achieve the recommended input capacitance.

TI recommends placing a ceramic capacitor as close as possible to the FET across the respective VSYS and PGND pins of the FETs. The preferred capacitors for the controllers are two Murata GRM21BR61E226ME44: 22 µF, 0805, 25V, ±20%, or similar capacitors.

8.2.2.2 Converter Design Procedure

Designing the converter has only two steps: design the output filter and select the input capacitors.

Figure 8-3 shows a diagram of the converter.

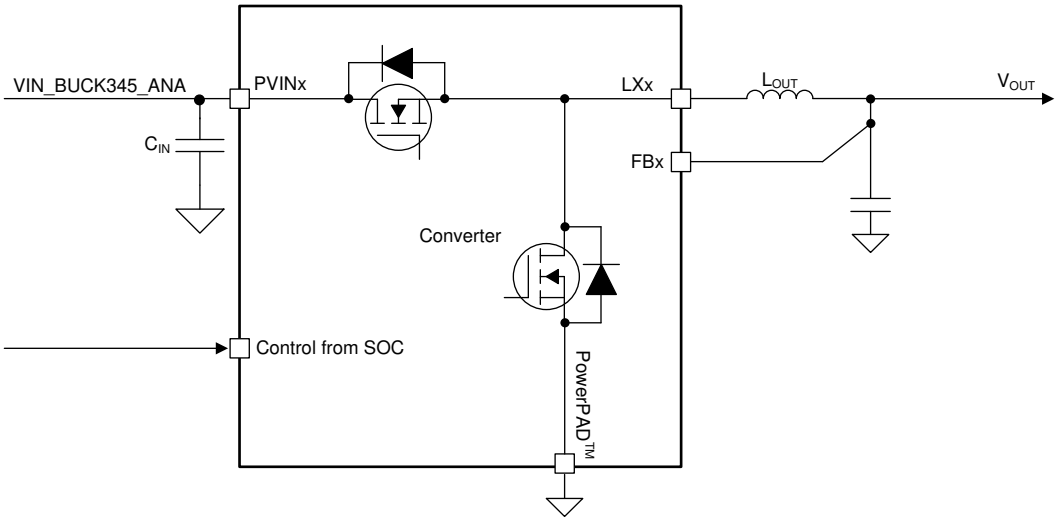


Figure 8-3. Converter Diagram

8.2.2.2.1 Selecting the Inductor

Internal parameters for the converters are optimized for either a 0.47 µH or 1 µH inductor, however it is possible to use other inductor values as long as they are chosen carefully and thoroughly tested. The equations from Section 8.2.2.1.1 can be utilized again with the parameters changed to match those of the converters. Switching frequency estimates can be found in Section 6.15.

8.2.2.2.2 Selecting the Output Capacitors

Ceramic capacitors with low ESR values are recommended because they provide the lowest output voltage ripple. The output capacitor requires either an X7R or X5R rating. Y5V and Z5U capacitors, aside from the wide variation in capacitance over temperature, become resistive at high frequencies.

At light load currents, the converter operates in PFM mode and the output voltage ripple is dependent on the output-capacitor value and the PFM peak inductor current. Higher output-capacitor values minimize the voltage ripple in PFM mode. To achieve specified regulation performance and low output voltage ripple, the DC-bias characteristic of ceramic capacitors must be considered. The effective capacitance of ceramic capacitors drops with increasing DC-bias voltage.

For the output capacitors of the BUCK converters, TI recommends placing small ceramic capacitors between the inductor and load with many vias to the PGND plane. This solution typically provides the smallest and lowest-cost solution available.

The minimum output capacitance recommended is 22 µF for stability. Equation 7 and Equation 8 can be used to estimate the required output capacitance for a given load transient. Note that V_{IN} is different for the converters and that the switching frequency can be estimated using Section 6.15. Equation 9 can be neglected for converters as there is no on time extension and the V_{IN} - V_{OUT} term is typically smaller.

8.2.2.2.3 Selecting the Input Capacitors

Due to the nature of the switching converter with a pulsating input current, a low ESR input capacitor is required for best input-voltage filtering and for minimizing the interference with other circuits caused by high input-voltage spikes. For the PVINx pin, 2.5 µF of input capacitance (after derating) is required for most applications. A ceramic capacitor is recommended to achieve the low ESR requirement. However, the voltage rating and DC-bias characteristic of ceramic capacitors must be considered. The input capacitor can be increased without any limit for better input-voltage filtering.

Note

Use the correct value for the ceramic capacitor capacitance after derating to achieve the recommended input capacitance.

The preferred capacitor for the converters is one Samsung CL05A106MP5NUNC: 10 µF, 0402, 10 V, ±20%, or similar capacitor.

8.2.2.3 LDO Design Procedure

The VTT LDO must handle the fast load transients from the DDR memory for termination. Therefore, it is recommended to use ceramic capacitors to maintain a high amount of capacitance with low ESR on the VTT LDO outputs and inputs. The preferred output capacitors for the VTT LDO are the GRM188R60J226MEA0 from Murata (22 µF, 0603, 6.3 V, ±20%, or similar capacitors). The preferred input capacitor for the VTT LDO is the CL05A106MP5NUNC from Samsung (10 µF, 0402, 10 V, ±20%, or similar capacitor).

The remaining LDOs must have input and output capacitors chosen based on the values in Section 6.9.

8.2.3 Application Curves

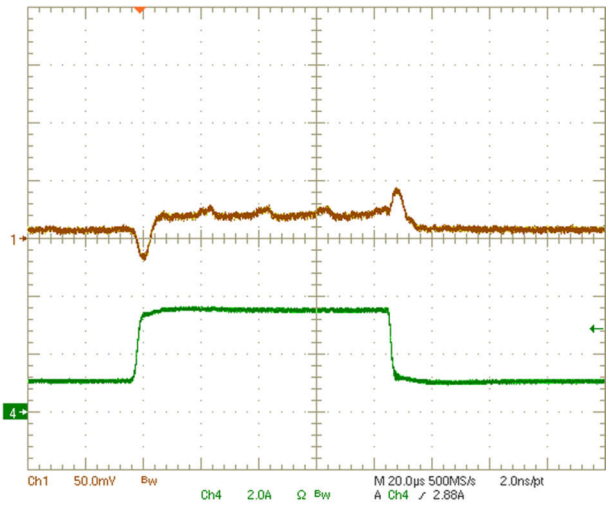
C_{OUT} = 2 × 300µF + 1 × 22µF

Figure 8-4. BUCK2 Controller Load Transient



L = PIFE32251B-R47ms C_{OUT} = 4 × 22µF

Figure 8-5. BUCK3 Converter Load Transient

8.2.4 Layout

8.2.4.1 Layout Guidelines

For a detailed description regarding layout recommendations, refer to the *TPS65086x Design Guide* and to the *TPS65086x Schematic and Layout Checklist*. For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator can have stability problems and EMI issues. Therefore, use wide and short traces for the main current path and for the power ground tracks. The input capacitors, output capacitors, and inductors must be placed as close as possible to the device. Use a common-ground node for power ground and use a different, isolated node for control ground to minimize the effects of ground noise. Connect these ground nodes close to the AGND pin by one or two vias. Use of the design guide is highly encouraged in addition to the following list of other basic requirements:

- Do *not* allow the AGND, PGNDSNSx, or FBGND2 to connect to the thermal pad on the top layer.
- To ensure proper sensing based on FET R_{DSON}, PGNDSNSx must not connect to PGND until very close to the PGND pin of the FET.
- All inductors, input and output capacitors, and FETs for the converters and controller must be on the same board layer as the IC.
- To achieve the best regulation performance, place feedback connection points near the output capacitors and minimize the control feedback loop as much as possible.
- Bootstrap capacitors must be placed close to the device.
- The internal reference regulators must have their input and output capacitors placed close to the device pins.
- Route DRVHx and SWx as a differential pair. Ensure that there is a PGND path routed in parallel with DRVLx, which provides optimal driver loops.

8.2.4.2 Layout Example

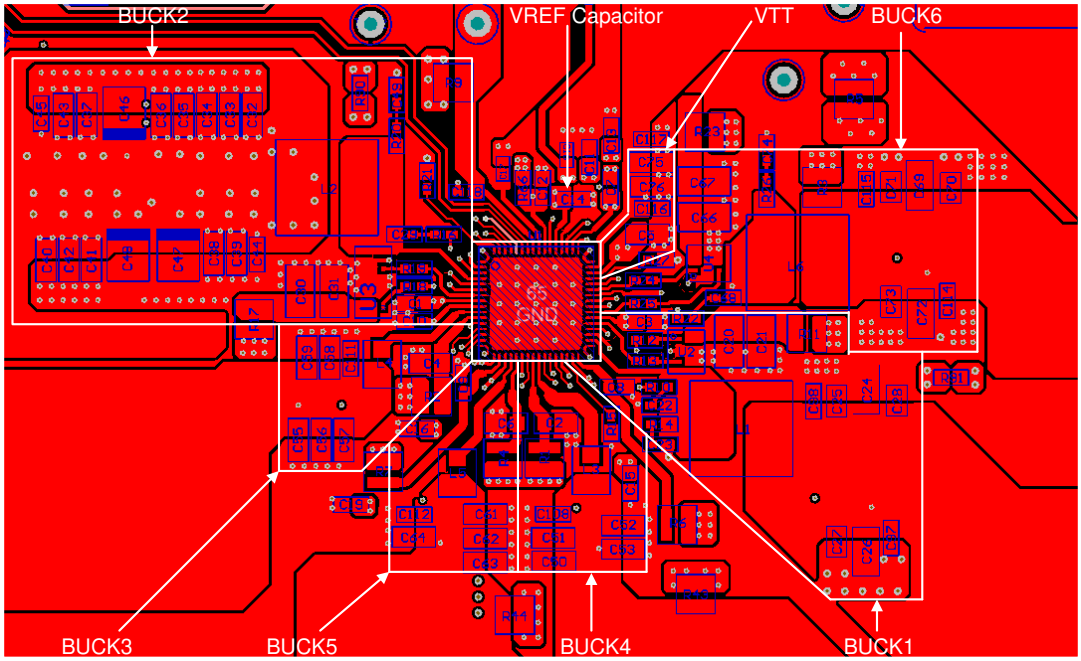


Figure 8-6. EVM Layout Example With All Components on the Top Layer

8.2.5 VIN 5-V Application

The PMIC can be operated by a 5-V input voltage to the system because the power path of the controller does not go through the device itself. The concept is simple: supply the controller VINs with the 5-V input, and supply the VSYS with a 5.8 V step-up of the 5-V with a boost or charge pump. The 5.8 V is recommended because the UVLO of the internal LDO5 is at 5.6 V and the device measures the voltage at VSYS and determines the optimum internal compensation and controller settings thus, it is ideal the VSYS be close to the VIN of the controllers.

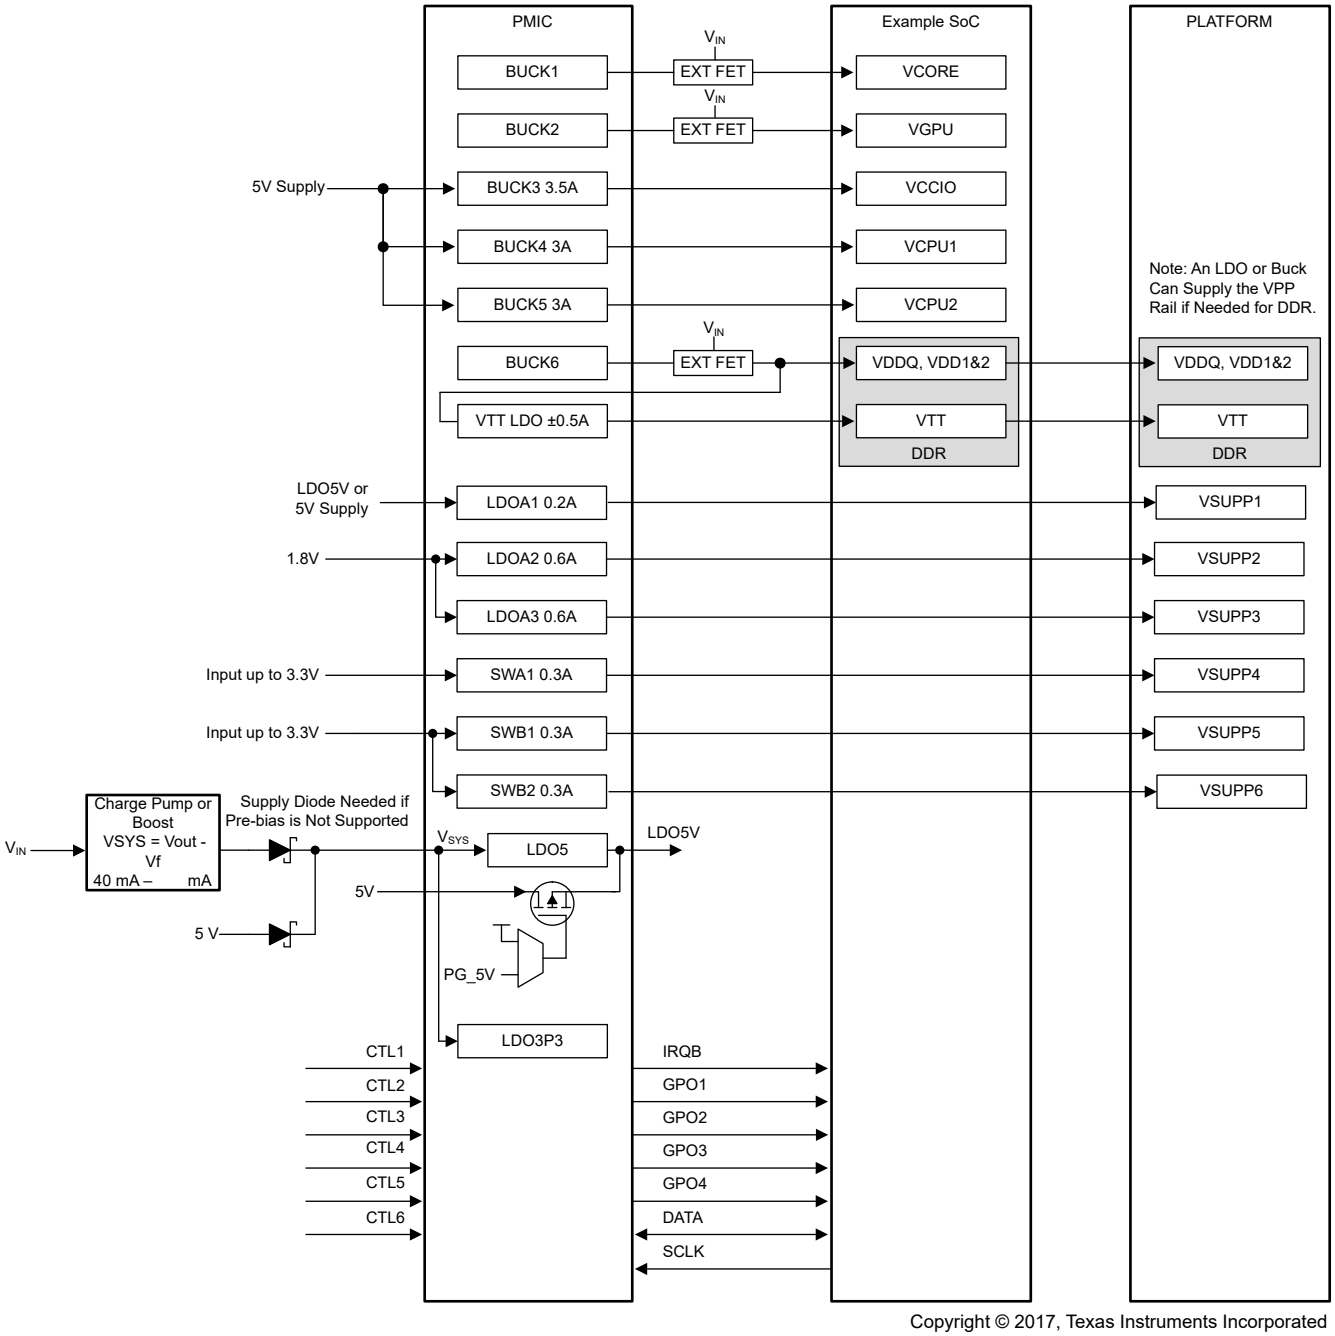

Figure 8-7. VIN 5-V Application

8.2.5.1 Design Requirements

The PMIC requires a step-up voltage from the 5-V input to 5.8 V for the VSYS supply. TI recommends keeping the VSYS near 5.8 V for optimization of the controllers.

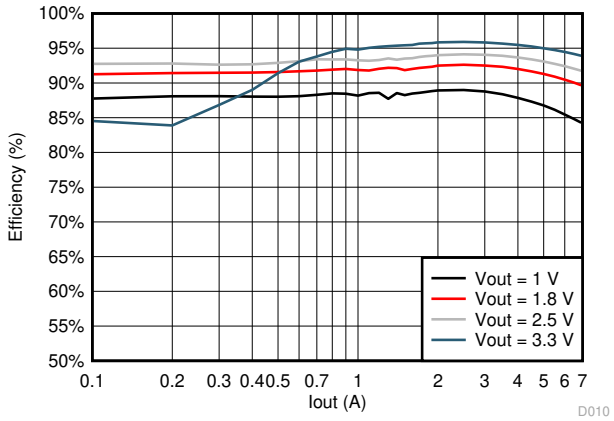
Depending on the application use cases, the supply current to the VSYS can require from 40 mA with the drivers being supplied by the 5-V input to 440 mA with the drivers being supplied by the LDO5 and the LDOA1 being operated at max loading. The varying current requirement means that a charge pump may be used in some applications like the 5-V input but in others, a small boost may be required.

A Schottky diode from the 5-V input to the VSYS is recommended to ensure the VSYS is biased and the internal reference LDOs are on before the step-up regulator is enabled or fully ramped up. If the step-up cannot tolerate pre-bias condition then, 2 diodes may be needed to prevent the initial 5-V supply biasing the output of the step-up.

8.2.5.2 Design Procedure

To design a 5-V input application, first provide a step-up voltage from the 5-V input to the VSYS. Design the step-up to output a voltage near 5.8 V. Next, route the 5-V input to the controller and converter VINs. Thus, all power paths (*all high currents*) are routed through the controllers or directly to the converters. None of the high currents are required from the step-up supply. After the input stage is complete, the rest of the system can be designed as normal following the typical application procedure, using 5 V as the input value to the controllers.

8.2.5.3 Application Curves



FET = CSD87381P L = PIMB061H-R47 ms

Figure 8-8. BUCK1 Efficiency at V_{IN} = 5 V

8.3 Power Supply Coupling and Bulk Capacitors

This device is designed to work with several different input voltages. The minimum voltage on the VSYS pin is 5.6 V for the device to start up; however, this is a low power rail. The input to the FETs must be from 4.5 V to 21 V as long as the proper BOM choices are made. Input to the converters must be between 3.3 V and 5 V. For the device to output maximum power, the input power must be sufficient. For the controllers, VIN must be able to supply sufficient input current for the output power of the application. For the converters, PVINx must be able to typically supply 2 A.

A best practice here is to determine power usage by the system and back-calculate the necessary power input based on expected efficiency values.

8.4 Dos and Don'ts

- Connect the LDO5V output to the DRV5V_x_x inputs for situations where an external 5V supply is not initially available or is not available the entire time PMIC is on. If the external 5V supply is always present, then DRV5V_x_x can be directly connected to remove the V5ANA-to-LDO5P0 load switch R_{DSON}.
- Ensure that none of the control pins are potentially floating.
- Include 0-Ω resistors on the DRVH or BOOT pins of controllers on prototype boards, which allows for slowing the controllers if the system is unable to handle the noise generated by the large switching or if switching voltage is too large due to layout.
- Do **not** connect the V5ANA power input to a different source other than PVINx. A mismatch here causes reference circuits to regulate incorrectly.
- Do **not** supply the V5ANA power input before the VSYS. Reference biasing of the internal FETs may turn on the HS FET passing the input to the output until VSYS is biased.
- Do **not** change the values of the reserved bits when writing I^2C, this can have unexpected consequences. Expected values for each OTP are shown in the register map.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (October 2024) to Revision G (January 2025) **Page**

- Changed minimum storage temperature from –40 °C to –55 °C....9
- Changed order of bits in MISCSYSPG Register (offset = ACh)....97

Changes from Revision E (December 2022) to Revision F (October 2024) **Page**

- Changed the power-up sequence for LDOA1 of TPS6508641 in the *TPS6508641 Power-Up Sequence* diagram....33
- Updated BUCK5 and VTT LDO voltage levels for CTL6 status in the *TPS65086470 Power-Up Sequence* diagram....39

Changes from Revision D (November 2020) to Revision E (December 2022) **Page**

- Changed the power-up sequence for TPS6508640 in the *TPS6508640 Power-Up Sequence* diagram....24
- Changed the power-down sequence for TPS6508640 in the *TPS6508640 Power-Down Sequence* diagram 24
- Changed the OTP_VERSION[1:0] bits from 01 to 10 for the TPS6508640 device in the *DEVICEID2 Register* table....63
- Changed the OTP_VERSION[1:0] bits from 00 to 01 for the TPS65086401 and TPS6506470 devices in the *DEVICEID2 Register* table....63

Changes from Revision C (June 2018) to Revision D (November 2020) **Page**

- Updated the numbering format for tables, figures, and cross-references throughout the document....1
- Changed the incorrect LX3 pin description from *connect to ground when not in use* to *leave floating when not in use* in the *Pin Functions* table....5
- Removed the line above the LDOA1 block in the *PMIC Functional Block Diagram* 22
- Removed incorrect VREF notes from the middle and right DDR blocks in the *Power Map Example* figure....22
- Added *when configured as push-pull, LDO3P3 is used for logic-level high* to the *Power Good Tree* figure description 51
- Changed the bit values for BUCK4_MODE bits in the *BUCK4CTRL Register* table from 0 to 1 for the TPS65086401 and TPS65086470 devices 68
- Changed the bit values for BUCK5_MODE bits in the *BUCK5CTRL Register* table from 0 to 1 for the TPS65086401 and TPS65086470 devices 69
- Added links and step ranges to *BUCK2SLPCTRL Register Descriptions* table....77
- Changed the bit values for BUCK3_MODE bits in the *BUCK123CTRL Register* table from 0 to 1 for the TPS65086401 and TPS65086470 devices....81
- Removed the incorrect VREF notes from the middle and right DDR blocks in the *VIN 5-V Application* diagram 106

Changes from Revision B (December 2017) to Revision C (June 2018) **Page**

- Added TPS6508640 and TPS6508641 to data manual 1
- Added typical MPSoC variants to *Device Comparison Table* 4
- Added BUCKx_MODE test condition for quiescent current 13

- Added BUCKx_MODE information to relevant graphs 19
- Changed the *TPS65086401 Power Map Example* in the *TPS65086401 Design and Settings* section..... 29
- Changed the *TPS65086470 Power Map Example* in the *TPS65086470 Design and Settings* section 39
- Added information regarding ILIM resistor minimum value for Force PWM condition 50

Changes from Revision A (November 2017) to Revision B (December 2017) **Page**

- Changed TPS65086401 from preview to production data.....4

Changes from Revision * (February 2017) to Revision A (November 2017) **Page**

- Changed device status from: PRODUCT PREVIEW to: PRODUCTION DATA 1
- Added pin connection when unused.....5
- Changed the *TPS65086401 Power Map Example* in the *TPS65086401 Design and Settings* section..... 29
- Fixed SWB1 and SWB2 current to 0.4A from 0.3A 39
- Changed typo from TPS6508470 to TPS65086470..... 42
- Changed description to *Sleep State* from *Connected Standby* for consistency in the *Sleep State Entry and Exit* section..... 57
- Changed the description of all PGOODs in the note in the *Sleep State Entry and Exit* section from *stay* to *can stay* because the behavior can vary based on the part-number specific settings..... 57
- Added failure to reach power good within 10ms as emergency shutdown condition to the *Emergency Shutdown* section..... 57
- Changed bit 0 in the *BUCK3VID Register* register to Read only (R) 67
- Changed the *PG_DELAY2: 2nd Power Good Delay Register* description from *GPO3* to *GPO1, GPO2, and GPO4* 82
- Fixed a typo which showed the '000' option resulting in 2.5 ms instead of 0 ms in the *PG_DELAY2 Register Descriptions* table..... 82

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5–1994.
B. This drawing is subject to change without notice.
C. QFN (Quad Flatpack No–Lead) Package configuration.
D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

RSK (S–PVQFN–N64) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

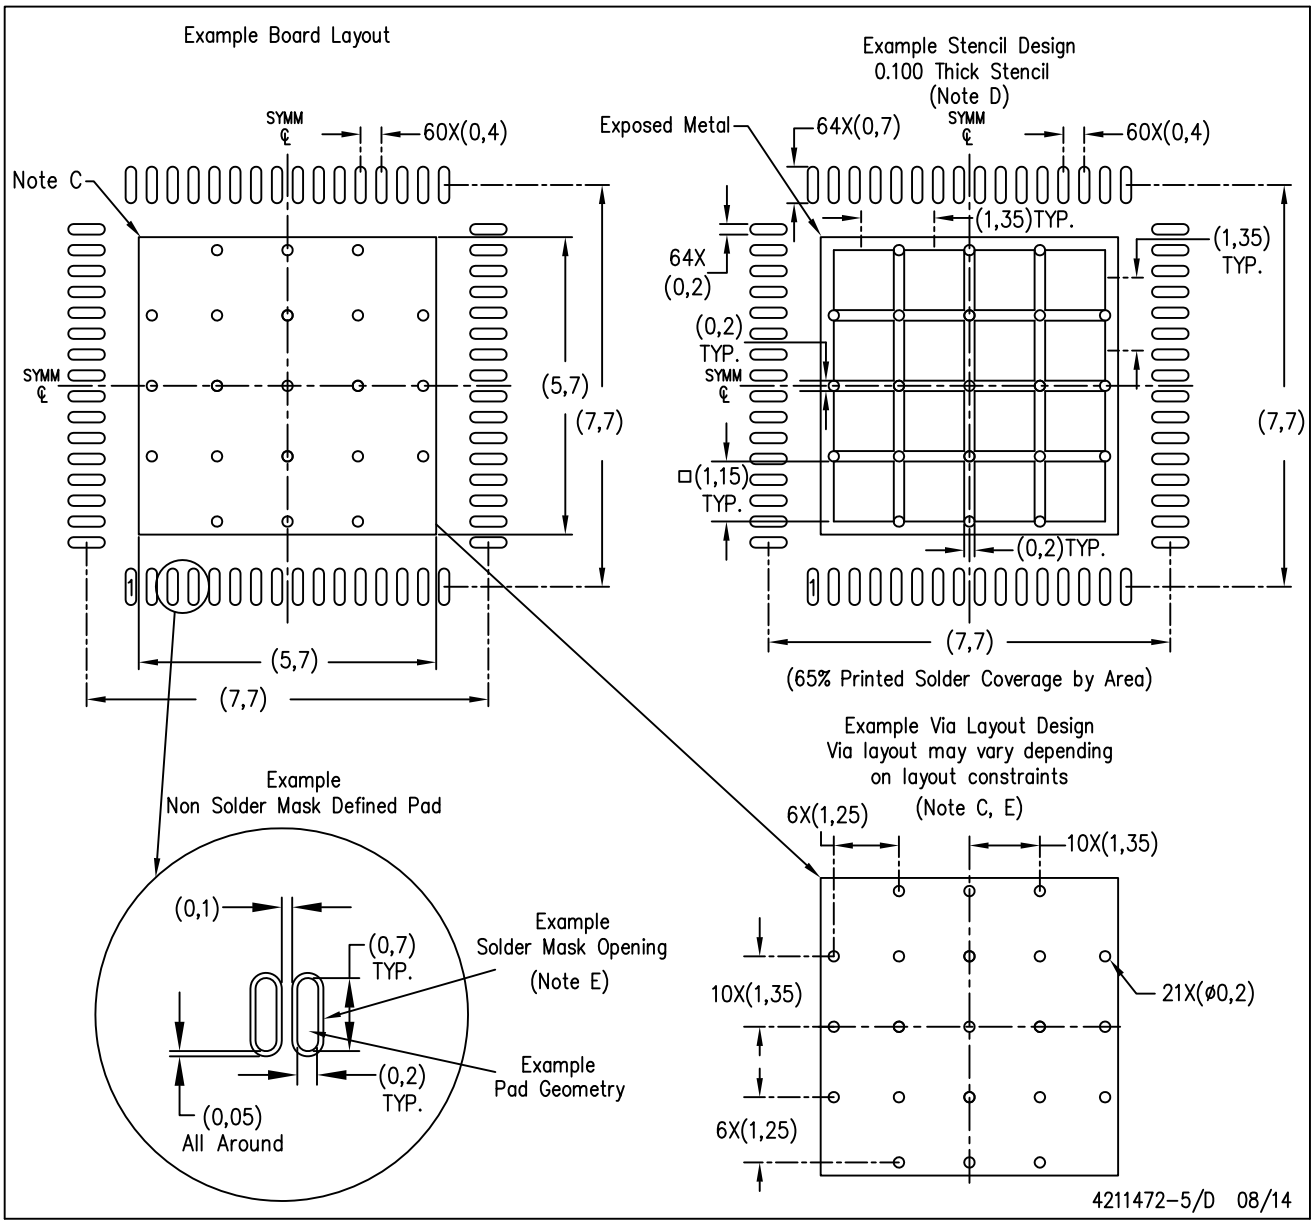
NOTE: A. All linear dimensions are in millimeters

RSK (S–PVQFN–N64) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat–Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
E. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for any larger diameter vias placed in the thermal pad.

IMPORTANT NOTICE AND DISCLAIMER
