

OMNIFET III fully protected low-side driver

Datasheet - production data

Description

The VNL5030J-E and VNL5030S5-E are monolithic devices made using STMicroelectronics® VIPower® technology, intended for driving resistive or inductive loads with one side connected to the battery. Built-in thermal shutdown protects the chip from overtemperature and short-circuit. Output current limitation protects the devices in an overload condition. In case of long duration overload, the device limits the dissipated power to a safe level up to thermal shutdown intervention. Thermal shutdown, with automatic restart, allows the device to recover normal operation as soon as a fault condition disappears. Fast demagnetization of inductive loads is achieved at turn-off.

Features

Type	V _{clamp}	R _{DS(on)}	I _D
VNL5030J-E	41 V	30 mΩ	25 A
VNL5030S5-E			

- Automotive qualified
- Drain current: 25 A
- ESD protection
- Overvoltage clamp
- Thermal shutdown
- Current and power limitation
- Very low standby current
- Very low electromagnetic susceptibility
- Compliant with European directive 2002/95/EC
- Open drain status output

2 Electrical specifications

2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 4](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

3 Application information

Figure 14. Application schematic

3.1 MCU I/O protection

ST suggests to insert a resistor (R_{prot}) in line to prevent the microcontroller I/O pins from latching up^(a). The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the LSD I/Os (input levels compatibility) with the latch-up limit of microcontroller I/Os:

Equation 1

$$\frac{0.7}{I_{\text{latchup}}} \leq R_{\text{prot}} \leq \frac{(V_{\text{OH}\mu\text{C}} - V_{\text{IH}})}{I_{\text{IH max}}}$$

Let:

- $I_{\text{latchup}} \geq 20 \text{ mA}$
- $V_{\text{OH}\mu\text{C}} \geq 4.5 \text{ V}$
- $35 \Omega \leq R_{\text{prot}} \leq 100 \text{ K}\Omega$

a. In case of negative transient on the drain pin.

Then, the recommended value is $R_{\text{prot}} = 1 \text{ K}\Omega$

Figure 15 shows the turn-off current drawn during the demagnetization.
