SLDS031A – APRIL 1985 – REVISED APRIL 1993

- Each Device Drives 32 Electrodes
- 90-V Output Voltage Swing Capability Using Ramped Supply
- 15-mA Output Source and Sink Current Capability
- High-Speed Serially-Shifted Data Input
- Totem-Pole Outputs
- Latches on All Driver Outputs

description

The SN65555, SN75555, SN65556, and SN75556 are monolithic BIDFET[†] integrated circuits designed to drive the column electrodes of an electroluminescent display. The SN65556 and SN75556 output sequence is reversed from the SN65555 and SN75555 for ease in printed-circuit-board layout.

The devices consist of a 32-bit shift register, 32 latches, and 32 output AND gates. Serial data is entered into the shift register on the low-to-high transition of CLOCK. When high, LATCH ENABLE transfers the shift register contents to the outputs of the 32 latches. When OUTPUT ENABLE is high, all Q outputs are enabled. Data must be loaded into the latches and OUTPUT ENABLE must be high before supply voltage V_{CC2} is ramped up.

Serial data output from the shift register can be used to cascade shift registers. This output is not affected by LATCH ENABLE or OUTPUT ENABLE.

The SN65555 and SN65556 are characterized for operation from -40°C to 85°C . The SN75555 and SN75556 are characterized for operation from 0°C to 70°C .

H = high level, L = low level, X = irrelevant, ↑ = low-to-high-level transition.

† R32 and the serial output take on the state of R31, R31 takes on the state of R30, . . . R2 takes on the state of R1, and R1 takes on the state of the data input.

‡ New data enter the latches while LATCH ENABLE is high. These data are stored while LATCH ENABLE is low.
