Low-Voltage Single SPDT Analog Switch

DESCRIPTION

The DG9461 is a single-pole/double-throw monolithic CMOS analog device designed for high performance switching of analog signals. Combining low power, high speed (t_{ON}: 35 ns, t_{OFF}: 20 ns), low on-resistance ($r_{DS(on)}$: 40 Ω) and small physical size (TSOP-6), the DG9461 is ideal for portable and battery powered applications requiring high performance and efficient use of board space.

The DG9461 is built on Vishay Siliconix's low voltage BCD-15 process. Minimum ESD protection, per Method 3015.7, is 2000 V. An epitaxial layer prevents latchup. Break-before-make is guaranteed for DG9461.

Each switch conducts equally well in both directions when on, and blocks up to the power supply level when off.

d. Guarantee by design, nor subjected to production test.
e. V_{IN} = input voltage to perform proper function.
f. Difference of min and max values.
g. Gurauranteed by 5 V leakage testing, not production tested.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
