- High Output Drivers: $\pm 24mA$ (B port)

DESCRIPTION:

This 16-bit bus transceiver is built using advanced dual metal CMOS technology. The ALVC162245 is designed for asynchronous communication between data buses. The control-function implementation minimizes external timing requirements.

This device can be used as two 8-bit transceivers or one 16-bit transceiver. It allows data transmission from the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input. The output-enable ($\overline{OE}$) input can be used to disable the device so that the buses are effectively isolated.

The ALVC162245 has series resistors in the device output structure of the "A" port which will significantly reduce line noise when used with light loads. This driver has been designed to drive $\pm 12mA$ at the designated threshold levels. The "B" port has a $\pm 24mA$ driver.

APPLICATIONS:

- 3.3V high speed systems
- 3.3V and lower voltage computing systems
