General Description

The LCX126 contains four independent non-inverting buffers with 3-STATE outputs. Each output is disabled when the associated output-enable (OE) input is LOW. The inputs tolerate voltages up to 7V allowing the interface of 5V systems to 3V systems.

The 74LCX126 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

The schematic diagram illustrates a 1-bit full adder implemented using a GTO (General Purpose Transistor) block. The circuit features two input stages, each enclosed in a dashed box labeled "input stage".

Input Stages:

- Top Input Stage:** Receives a "Data" input. It includes an ESD (Electrostatic Discharge) protection diode (D2) connected to ground, a diode (N+/P-) connected to ground, and a PMOS transistor (P1) and an NMOS transistor (N1) in a common-source configuration.
- Bottom Input Stage:** Receives an "Enable" input. It includes an ESD protection diode (D4) connected to ground, a diode (N+/P-) connected to ground, and a PMOS transistor (P3) and an NMOS transistor (N3) in a common-source configuration.

Logic and Output:

- The outputs of the input stages are connected to a network of PMOS and NMOS transistors (P2, N2, P4, N4) and logic gates (AND, OR, NOT).
- The GTO block is a central component with multiple inputs and outputs. It is connected to the logic gates and the output stage.
- The output stage includes a PMOS transistor (P5) and an NMOS transistor (N5) in a common-source configuration, driving the "Output" signal.
- The output signal is also connected to a diode (D6, N+/P-) connected to ground and a diode (X1) connected to V_{DD}.

Power and Ground:

- The circuit is powered by V_{CC} and V_{DD} supply rails.
- Ground connections are indicated by symbols labeled "GND".
