# KAI-08052

## 3296 (H) x 2472 (V) Interline CCD Image Sensor

### Description

The KAI-08052 Image Sensor is an 8-megapixel, 4/3" optical format CCD that provides increased Quantum Efficiency (particularly for NIR wavelengths) compared to members of the standard 5.5  $\mu\text{m}$  family.

The sensor shares the same broad dynamic range, excellent imaging performance, and flexible readout architecture as other members of the 5.5  $\mu\text{m}$  pixel family. But QE at 820 nm has been approximately doubled compared to existing devices, enabling enhanced sensitivity without a corresponding decrease in the Modulation Transfer Function (MTF) of the device.

The KAI-08052 is available with the Sparse Color Filter Pattern, which provides a 2x improvement in light sensitivity compared to a standard color Bayer part.

The KAI-08052 is drop-in compatible with the KAI-08051 Image Sensor, simplifying adoption by camera manufacturers currently working with the KAI-08051.

**Table 1. GENERAL SPECIFICATIONS**

| Parameter                                                      | Typical Value                                                       |
|----------------------------------------------------------------|---------------------------------------------------------------------|
| Architecture                                                   | Interline CCD; Progressive Scan                                     |
| Total Number of Pixels                                         | 3364 (H) x 2520 (V)                                                 |
| Number of Effective Pixels                                     | 3320 (H) x 2496 (V)                                                 |
| Number of Active Pixels                                        | 3296 (H) x 2472 (V)                                                 |
| Pixel Size                                                     | 5.5 $\mu\text{m}$ (H) x 5.5 $\mu\text{m}$ (V)                       |
| Active Image Size                                              | 18.13 mm (H) x 13.60 mm (V)<br>22.66 mm (diag), 4/3" optical format |

**Figure 1. KAI-08052 CCD Image Sensor**

### Features

- Increased QE, with 2x Improvement at 820 nm
- Bayer Color, Sparse Color, and Monochrome Configurations
- Progressive Scan Readout
- Flexible Readout Architecture
- High Sensitivity, Low Noise Architecture
- Excellent Smear Performance

### Applications

- Scientific and Medical Imaging
- Intelligent Transportation Systems
- Machine Vision

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

See the ON Semiconductor *Device Nomenclature* document (TND310/D) for a full description of the naming convention used for image sensors. For reference documentation, including information on evaluation kits, please visit our web site at [www.onsemi.com](http://www.onsemi.com).

## DEVICE DESCRIPTION

### Architecture

Figure 2. Block Diagram (Monochrome – No Filter Pattern)

#### Dark Reference Pixels

There are 12 dark reference rows at the top and 12 dark rows at the bottom of the image sensor. The dark rows are not entirely dark and so should not be used for a dark reference level. Use the 22 dark columns on the left or right side of the image sensor as a dark reference.

Under normal circumstances use only the center 20 columns of the 22 column dark reference due to potential light leakage.

#### Dummy Pixels

Within each horizontal shift register there are 11 leading additional shift phases. These pixels are designated as dummy pixels and should not be used to determine a dark reference level.

In addition, there is one dummy row of pixels at the top and bottom of the image.

#### Active Buffer Pixels

12 unshielded pixels adjacent to any leading or trailing dark reference regions are classified as active buffer pixels. These pixels are light sensitive but are not tested for defects and non-uniformities.

#### Image Acquisition

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photosite. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent upon light level and exposure time and non-linearly dependent on wavelength. When the photodiodes charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming.

### ESD Protection

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and

power-down sequences may cause damage to the sensor. See Power-Up and Power-Down Sequence section.

1. Liked named pins are internally connected and should have a common drive signal.
2. N/C pins (17, 51) should be left floating.

## IMAGING PERFORMANCE

**Table 4. TYPICAL OPERATION CONDITIONS**

Unless otherwise noted, the Imaging Performance Specifications are measured using the following conditions.

| Description  | Condition                                       | Notes                                       |
|--------------|-------------------------------------------------|---------------------------------------------|
| Light Source | Continuous red, green and blue LED illumination | For monochrome sensor, only green LED used. |
| Operation    | Nominal operating voltages and timing           |                                             |

1. Per color
2. Value is over the range of 10% to 90% of photodiode saturation.
3. The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such that the photodiode charge capacity is 800 mV.
4. At 40 MHz
5. Uses 20LOG (PNe/ n<sub>e-T</sub>)
6. Assumes 5 pF load.

## DEFECT DEFINITIONS

Table 9. OPERATION CONDITIONS FOR DEFECT TESTING AT 40°C

| Description                 | Condition                                                           | Notes |
|-----------------------------|---------------------------------------------------------------------|-------|
| Operational Mode            | Two outputs, using VOUTa and VOUTc, continuous readout              |       |
| HCCD Clock Frequency        | 10 MHz                                                              |       |
| Pixels Per Line             | 3520                                                                | 1     |
| Lines Per Frame             | 1360                                                                | 2     |
| Line Time                   | 354.9 $\mu$ s                                                       |       |
| Frame Time                  | 482.7 ms                                                            |       |
| Photodiode Integration Time | Mode A: PD_Tint = Frame Time = 482.7 ms, no electronic shutter used |       |
|                             | Mode B: PD_Tint = 33 ms, electronic shutter used                    |       |
| VCCD Integration Time       | 447.2 ms                                                            | 3     |
| Temperature                 | 40°C                                                                |       |
| Light Source                | Continuous red, green and blue LED illumination                     | 4     |
| Operation                   | Nominal operating voltages and timing                               |       |

1. Horizontal overclocking used.
2. Vertical overclocking used.
3. VCCD Integration Time = 1260 lines x Line Time, which is the total time a pixel will spend in the VCCD registers.
4. For monochrome sensor, only the green LED is used.

Table 10. DEFECT DEFINITIONS FOR TESTING AT 40°C

| Description                             | Definition                                                                                                        | Standard Grade | Notes |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------|----------------|-------|
| Major dark field defective bright pixel | PD_Tint = Mode A $\rightarrow$ Defect $\geq$ 191 mV<br>or<br>PD_Tint = Mode B $\rightarrow$ Defect $\geq$ 13.8 mV | 80             | 1     |
| Major bright field defective dark pixel | Defect $\geq$ 12%                                                                                                 |                |       |
| Minor dark field defective bright pixel | PD_Tint = Mode A $\rightarrow$ Defect $\geq$ 99 mV<br>or<br>PD_Tint = Mode B $\rightarrow$ Defect $\geq$ 7 mV     | 800            |       |
| Cluster defect                          | A group of 2 to 10 contiguous major defective pixels, but no more than 3 adjacent defects horizontally.           | 15             | 2     |
| Column defect                           | A group of more than 10 contiguous major defective pixels along a single column                                   | 0              | 2     |

1. For the Bayer color device (KAI-08052-FBA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.
2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

| Lines Per Frame                       | 1360                                                                | 2     |
| Line Time                             | 177.8 $\mu$ s                                                       |       |
| Frame Time                            | 241.8 ms                                                            |       |
| Photodiode Integration Time (PD_Tint) | Mode A: PD_Tint = Frame Time = 241.8 ms, no electronic shutter used |       |
|                                       | Mode B: PD_Tint = 33 ms, electronic shutter used                    |       |
| VCCD Integration Time                 | 224.0 ms                                                            | 3     |
| Temperature                           | 27°C                                                                |       |
| Light Source                          | Continuous red, green and blue LED illumination                     | 4     |
| Operation                             | Nominal operating voltages and timing                               |       |

1. Horizontal overclocking used.
2. Vertical overclocking used.
3. VCCD Integration Time = 1260 lines x Line Time, which is the total time a pixel will spend in the VCCD registers.
4. For monochrome sensor, only the green LED is used.

**Table 12. DEFECT DEFINITIONS FOR TESTING AT 27°C**

| Description                             | Definition                                                                                                      | Standard Grade | Notes |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------|----------------|-------|
| Major dark field defective bright pixel | PD_Tint = Mode A $\rightarrow$ Defect $\geq$ 30 mV<br>or<br>PD_Tint = Mode B $\rightarrow$ Defect $\geq$ 4.6 mV | 80             | 1     |
| Major bright field defective dark pixel | Defect $\geq$ 12%                                                                                               |                |       |
| Cluster defect                          | A group of 2 to 10 contiguous major defective pixels, but no more than 3 adjacent defects horizontally.         | 15             | 2     |
| Column defect                           | A group of more than 10 contiguous major defective pixels along a single column                                 | 0              | 2     |

1. For the Bayer color device (KAI-08052-FBA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.
2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

### Defect Map

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point

defects are not included in the defect map. All defective pixels are reference to pixel 1, 1 in the defect maps. See Figure 14: Regions of interest for the location of pixel 1,1.

## TEST DEFINITIONS

### Test Regions of Interest

Image Area ROI: Pixel (1, 1) to Pixel (3320, 2496)  
 Active Area ROI: Pixel (13, 13) to Pixel (3308, 2484)  
 Center ROI: Pixel (1611, 1199) to Pixel (1710, 1298)  
 Only the Active Area ROI pixels are used for performance and defect tests.

### Overclocking

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions.

See Figure 14 for a pictorial representation of the regions of interest.

Figure 14. Regions of Interest

### Tests

#### Dark Field Global Non-Uniformity

This test is performed under dark field conditions. The sensor is partitioned into 768 sub regions of interest, each of which is 103 by 103 pixels in size. The average signal level of each of the 768 sub regions of interest is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

Signal of ROI[i] = (ROI Average in counts – Horizontal overclock average in counts) \* mV per count

Where i = 1 to 768. During this calculation on the 768 sub regions of interest, the maximum and minimum signal levels are found. The dark field global uniformity is then calculated as the maximum signal found minus the minimum signal level found.

Units: mVpp (millivolts peak to peak)

*Global Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 560 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 800 mV. Global non-uniformity is defined as

$$\text{GlobalNon-Uniformity} = 100 \times \left( \frac{\text{ActiveAreaStandardDeviation}}{\text{ActiveAreaSignal}} \right)$$

Units: %rms.

Active Area Signal = Active Area Average – Dark Column Average

*Global Peak to Peak Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 560 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 800 mV. The sensor is partitioned into 768 sub regions of interest, each of which is 103 by 103 pixels in size. The average signal level of each of the 768 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

Signal of ROI[i] = (ROI Average in counts – Horizontal overclock average in counts) \* mV per count

Where i = 1 to 768. During this calculation on the 768 sub regions of interest, the maximum and minimum signal levels are found. The global peak to peak uniformity is then calculated as:

$$\text{GlobalUniformity} = 100 \times \frac{\text{MaximumSignal} - \text{MinimumSignal}}{\text{ActiveAreaSignal}}$$

Units: %pp

*Center Non-Uniformity*

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 560 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 800 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels of the sensor. Center uniformity is defined as:

$$\text{Center ROI Uniformity} = 100 \times \left( \frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}} \right)$$

Units: %rms.

Center ROI Signal = Center ROI Average – Dark Column Average

*Dark Field Defect Test*

This test is performed under dark field conditions. The sensor is partitioned into 768 sub regions of interest, each of which is 103 by 103 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the “Defect Definitions” section.

*Bright Field Defect Test*

This test is performed with the imager illuminated to a level such that the output is at approximately 476 mV. Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

Dark defect threshold = Active Area Signal \* threshold

Bright defect threshold = Active Area Signal \* threshold

The sensor is then partitioned into 768 sub regions of interest, each of which is 103 by 103 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 560 mV
- Dark defect threshold: 560 mV \* 12 % = 67 mV
- Bright defect threshold: 560 mV \* 12 % = 67 mV
- Region of interest #1 selected. This region of interest is pixels 13, 13 to pixels 115, 115.
  - ♦ Median of this region of interest is found to be 560 mV.
  - ♦ Any pixel in this region of interest that is  $\geq (560 + 67 \text{ mV})$  627 mV in intensity will be marked defective.
  - ♦ Any pixel in this region of interest that is  $\leq (560 - 67 \text{ mV})$  493 mV in intensity will be marked defective.
- All remaining 768 sub regions of interest are analyzed for defective pixels in the same manner.

## OPERATION

**Table 13. ABSOLUTE MAXIMUM RATINGS**

| Description           | Symbol    | Minimum | Maximum | Units | Notes |
|-----------------------|-----------|---------|---------|-------|-------|
| Operating Temperature | $T_{OP}$  | -50     | 70      | °C    | 1     |
| Humidity              | RH        | 5       | 90      | %     | 2     |
| Output Bias Current   | $I_{out}$ |         | 60      | mA    | 3     |
| Off-chip Load         | $C_L$     |         | 10      | pF    |       |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Noise performance will degrade at higher temperatures.
- $T = 25^{\circ}\text{C}$ . Excessive humidity will degrade MTTF.
- Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

**Table 14. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND**

| Description                                                                                                        | Minimum   | Maximum    | Units | Notes |
|--------------------------------------------------------------------------------------------------------------------|-----------|------------|-------|-------|
| $VDD_{\alpha}$ , $VOUT_{\alpha}$                                                                                   | -0.4      | 15.5       | V     | 1     |
| $RD_{\alpha}$                                                                                                      | -0.4      | 15.5       | V     | 1     |
| $V1B$ , $V1T$                                                                                                      | ESD - 0.4 | ESD + 24.0 | V     |       |
| $V2B$ , $V2T$ , $V3B$ , $V3T$ , $V4B$ , $V4T$                                                                      | ESD - 0.4 | ESD + 14.0 | V     |       |
| $H1S_{\alpha}$ , $H1B_{\alpha}$ , $H2S_{\alpha}$ , $H2B_{\alpha}$ , $H2SL_{\alpha}$ , $R_{\alpha}$ , $OG_{\alpha}$ | ESD - 0.4 | ESD + 14.0 | V     | 1     |
| ESD                                                                                                                | -10.0     | 0.0        | V     |       |
| SUB                                                                                                                | -0.4      | 40.0       | V     | 2     |

- $\alpha$  denotes a, b, c or d
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*. (AND9183/D)

### Power-Up and Power-Down Sequence

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

**Figure 15. Power-Up and Power-Down Sequence**

Notes:

- Activate all other biases when  $ESD$  is stable and  $SUB$  is above 3 V
- Do not pulse the electronic shutter until  $ESD$  is stable
- $VDD$  cannot be +15 V when  $SUB$  is 0 V
- The image sensor can be protected from an accidental improper  $ESD$  voltage by current

limiting the  $SUB$  current to less than 10 mA.  $SUB$  and  $VDD$  must always be greater than GND.  $ESD$  must always be less than GND. Placing diodes between  $SUB$ ,  $VDD$ ,  $ESD$  and ground will protect the sensor from accidental overshoots of  $SUB$ ,  $VDD$  and  $ESD$  during power on and power off. See the figure below.

The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage.

Figure 16.

Example of external diode protection for SUB, VDD and ESD.  $\alpha$  denotes a, b, c or d

Figure 17.

Table 15. DC BIAS OPERATING CONDITIONS

| Description             | Pins         | Symbol           | Minimum | Nominal | Maximum          | Units | Maximum DC Current | Notes   |
|-------------------------|--------------|------------------|---------|---------|------------------|-------|--------------------|---------|

| ESD Protection Disable  | ESD          | ESD              | -9.2    | -9.0    | V <sub>x_L</sub> | V     | 50 $\mu$ A         | 6, 7, 9 |
| Output Bias Current     | VOU $\alpha$ | I <sub>out</sub> | -3.0    | -7.0    | -10.0            | mA    |                    | 1, 4, 5 |

1.  $\alpha$  denotes a, b, c or d
2. The maximum DC current is for one output.  $I_{dd} = I_{out} + I_{ss}$ . See Figure 18.
3. The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such that the photodiode charge capacity is the nominal PNe (see Specifications).
4. An output load sink must be applied to each VOUT pin to activate each output amplifier.
5. Nominal value required for 40 MHz operation per output. May be reduced for slower data rates and lower noise.
6. Adherence to the power-up and power-down sequence is critical. See Power-Up and Power-Down Sequence section.
7. ESD maximum value must be less than or equal to V1\_L + 0.4 V and V2\_L + 0.4 V
8. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions (AND9183/D)*
9. Where V<sub>x\_L</sub> is the level set for V1\_L, V2\_L, V3\_L, or V4\_L in the application.

Figure 18. Output Amplifier

## AC Operating Conditions

Table 16. CLOCK LEVELS

| Description                                     | Pins <sup>(1)</sup> | Symbol             | Level     | Minimum             | Nominal | Maximum            | Units | Capacitance <sup>(2)</sup> |

- $\alpha$  denotes a, b, c or d
- Capacitance is total for all like named pins
- Use separate clock driver for improved speed performance.
- Reset low should be set to -3 V for signal levels greater than 40,000 electrons.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions (AND9183/D)*
- Capacitance values are estimated
- If the minimum horizontal clock low level is used (-5.2 V), then the maximum horizontal clock amplitude should be used (5.2 V amplitude) to create a -5.2 V to 0.0 V clock. If a 5 V clock driver is used, the horizontal low level should be set to -5.0 V and the high level should be a set to 0.0 V.

The figure below shows the DC bias (VSUB) and AC clock (VES) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

Figure 19.

### Device Identification

The device identification pin (DevID) may be used to determine which 5.5 micron pixel interline CCD sensor is being used. Note that the KAI-08052 shares the same Device ID value as the KAI-08050 and KAI-08051.

**Table 17. DEVICE IDENTIFICATION**

| Description           | Pins  | Symbol | Minimum | Nominal | Maximum | Units    | Maximum DC Current | Notes |
|-----------------------|-------|--------|---------|---------|---------|----------|--------------------|-------|
| Device Identification | DevID | DevID  | 8,000   | 10,000  | 12,000  | $\Omega$ | 50 $\mu$ A         | 1, 2  |

1. If the Device Identification is not used, it may be left disconnected.
2. Values specified are for 40°C.

### Recommended Circuit

Note that V1 must be a different value than V2.

**Figure 20. Device Identification Recommended Circuit**

## TIMING

Table 18. REQUIREMENTS AND CHARACTERISTICS

| Description            | Symbol           | Minimum | Nominal | Maximum | Units   | Notes               |
|------------------------|------------------|---------|---------|---------|---------|---------------------|
| Photodiode Transfer    | $t_{pd}$         | 1.0     | –       | –       | $\mu s$ |                     |

|                        |                  | 114.8   | –       | –       |         | Dual HCCD Readout   |
|                        |                  | 220.7   | –       | –       |         | Single HCCD Readout |

1. Refer to timing diagrams as shown in Figures 21, 22, 23, 24 and 25.
2. Refer to Figure 25: VCCD Clock Edge Alignment
3. Relative to the pulse width

### Timing Diagrams

The timing sequence for the clocked device pins may be represented as one of seven patterns (P1–P7) as shown in the table below. The patterns are defined in Figure 21 and

Figure 22. Contact ON Semiconductor Application Engineering for other readout modes.

**Table 19.**

| Device Pin          | Quad Readout | Dual Readout<br>VOUTa, VOUTb            | Dual Readout<br>VOUTa, VOUTc            | Single Readout<br>VOUTa                 |

|                         |      |      |      |      |
|-------------------------|------|------|------|------|
| # Lines/Frame (Minimum) | 1260 | 2520 | 1260 | 2520 |
| # Pixels/Line (Minimum) | 1693 |      | 3386 |      |

1. For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.
2. H2SLx follows the same pattern as H2Sx For optimal speed performance, use a separate clock driver.
3. Off = +5 V. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

### Photodiode Transfer Timing

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The “Last Line” is dependent on readout mode – either 632 or 1264 minimum counts required. It is important to note that, in

general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3<sup>rd</sup> level) state to the mid-state when P4 transitions from the low state to the high state.

Figure 21. Photodiode Transfer Timing

### Line and Pixel Timing

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as P6 pattern). The number of pixels in a row is dependent on

readout mode – either 853 or 1706 minimum counts required.

Figure 22. Line and Pixel Timing

## Pixel Timing Detail

Figure 23. Pixel Timing Detail

## Frame/Electronic Shutter Timing

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below.

The resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

## MECHANICAL INFORMATION

## Completed Assembly

Figure 27. Completed Assembly, Top and Side View

Notes:

1. See Ordering Information for marking code.
2. No materials to interfere with clearance through guide holes.
3. Recommended mounting screws: 1.6 X 0.35 mm (ISO Standard); 0 – 80 (Unified Fine Thread Standard)
4. Units: millimeters

**Figure 28. Completed Assembly, Bottom View**

## Notes:

1. No materials to interfere with clearance through guide holes.
2. Internal traces may be exposed on sides of package. Do not allow metal to contact sides of ceramic package.
3. Recommended mounting screws: 1.6 X 0.35 mm (ISO Standard); 0 – 80 (Unified Fine Thread Standard)
4. Units: millimeters

Figure 29. Completed Assembly, Side View with Glass and Die Detail

**Notes:**

1. No materials to interfere with clearance through guide holes.
2. Recommended mounting screws: 1.6 X 0.35 mm (ISO Standard); 0 – 80 (Unified Fine Thread Standard)
3. Units: millimeters

**Figure 30. Mechanical Details, Oblong Guide Hole**

### MAR Cover Glass

Notes:

1. Dust/Scratch count – 12 micron maximum
2. Units: mm

Figure 31. MAR Cover Glass

### Clear Cover Glass

Notes:

1. Dust/Scratch count – 10 micron maximum
2. Units: mm

## STORAGE AND HANDLING

**Table 20. STORAGE CONDITIONS**

| Description         | Symbol          | Minimum | Maximum | Units | Notes |
|---------------------|-----------------|---------|---------|-------|-------|
| Storage Temperature | T <sub>ST</sub> | -55     | 80      | °C    | 1     |
| Humidity            | RH              | 5       | 90      | %     | 2     |

1. Long term storage toward the maximum temperature will accelerate color filter degradation.
2. T = 25°C. Excessive humidity will degrade MTTF.
