

DS33Z44DK Ethernet Transport Design Kit

www.maxim-ic.com

GENERAL DESCRIPTION

The DS33Z44 design kit is an easy-to-use evaluation board for the DS33Z44 Ethernet transport-over-serial link device. The DS33Z44DK is intended to be used with a resource card for the serial link. The serial link resource cards are complete with transceivers, transformers, and network connections. Dallas' ChipView software is provided with the design kit, giving point-and-click access to configuration and status registers from a Windows®-based PC. On-board LEDs indicate receive loss-of-signal, queue overflow, Ethernet link, Tx/Rx, and interrupt status.

Windows is a registered trademark of Microsoft Corp.

ORDERING INFORMATION

PART	DESCRIPTION
DS33Z44DK	DS33Z44 demo card, T3/E3, T1/E1 transceiver resource card included

FEATURES

- Demonstrates Key Functions of DS33Z44 Ethernet Transport Chipset
- Includes Two Resource Cards: One with DS21458 T1/E1 SCT and one with DS3174 T3/E3 SCT, Transformers, BNC and RJ48 Network Connectors, and Termination
- Provides Support for Hardware and Software Modes
- On-Board MMC2107 Processor and ChipView Software Provide Point-and-Click Access to the DS33Z44 Register Set
- All DS33Z44 Interface Pins are Easily Accessible for External Data Source/Sink
- LEDs for Loss-of-Signal, Queue Overflow, Ethernet Link, Tx/Rx, and Interrupt Status
- Easy-to-Read Silkscreen Labels Identify the Signals Associated with All Connectors, Jumpers, and LEDs

DESIGN KIT CONTENTS

- DS33Z44DK Main Board
- Quad-Port Serial Card with DS21458 T1/E1 SCT
- Quad-Port Serial Card with DS3174 T3/E3 SCT
- CD_ROM
 - ChipView Software and Manual
 - DS33Z44DK Data Sheet
 - Configuration Files

COMPONENT LIST

[Table 1](#) shows the component list for the DS33Z44 and DS33Z11/DS33Z41 design kits and resource cards. This BOM contains the part listing for five boards. These boards are the DS33Z11DK, DS33Z44DK, DS21458RC, DS3174RC, and DS2155-DS21348-DS3170RC. Each reference designator is only used once. For example, U18 only appears on the DS33Z11DK and is not used on any of the other boards. See [Table 2](#).

Table 1. Component List (Decoupling Caps Not Shown)

Figure 1. System Floorplan

Figure 2. DS3174 Resource Card Floorplan

The DS3174 quad T3/E3 PC board floorplan is shown in [Figure 2](#). Jumpers JP16, JP17, JP18, and JP19 are 3-pin jumpers used to tri-state/enable T3/E3 ports. With the board oriented as shown in Figure 2, the top 2 pins of each jumper would be connected to enable T3/E3 traffic.

A 2-pin jumper, JP24, has been added to allow loopback. When installed, the board is in loopback at the CPLD; all traffic sent by the DS33Z44 is then sent back to the Z44. Traffic sent by the DS3174 is ignored in CPLD loopback mode.

The quad T3/E3 board is intended to be connected to the DS33Z11 or DS33Z44 motherboards. The quad T3/E3 board can be used with the quad T1/E1 board. When used in this manner, the quad T1/E1 board is stacked underneath the quad T3/E3 board. Jumpers on the T3/E3 board are then used to tri-state or enable individual ports on either board.

[Figure 3](#) shows the DS21458 quad T1/E1 PC board floorplan. The current configuration is to populate oscillators for MCLK1 with a 2.048MHz oscillator. Testpoints for port 3 and port 4 are provided on the WAN card, and testpoints for ports 1 and 2 are provided on the motherboard.

The quad T1/E1 board can be used with the quad T3/E3 board. When used in this manner, the quad T1/E1 board is stacked underneath the quad T3/E3 board. Jumpers on the T3/E3 board are then used to tri-state or enable individual ports on either board.

Figure 3. DS21458 Resource Card Floorplan

PC BOARD ERRATA

- Silk screen for the serial resource card has V_{CC} and ground indicators pointing the wrong direction for configuration switches SW27, SW28, and SW32. This should be corrected with an adhesive label.
- Signal descriptions for JTAG connector are incorrect on the Quad T1E1 card. This should be corrected with an adhesive label.
- In the PCB layout the transformer TX primary is on the wrong side (creating a 2:1 winding instead of a 1:2). This has been corrected in the schematic, the PCB / assembly has been modified to correct this.

FILE LOCATIONS

This design kit relies upon several supporting files, which are provided on the CD and are available as a zip file from the Maxim website at www.maxim-ic.com/DS33Z44DK.

All locations are given relative to the top directory of the CD/zip file.

BASIC OPERATION

Powering Up the Design Kit

- Attach resource card to main board.
- Connect PCB 3.3V and GND banana plugs to power supply. At power-up the system should draw approximately 1A.
- Set switches for software mode as described in [Table 2](#) (short description follows).
 - Top left bank: All low, except for MODEC0, which is high.
 - Top right bank: A2, A1, A0 in mid position, SCANTRI low
 - Bottom Bank: All high (AFCS, FULLDS, H1OS)

General

- Upon power-up, the processor FPGA Status LEDs (DS19 green) will be lit. Interrupt LEDs (DS42 red) will not be lit. DS33Z44 Queue overflow LEDs (DS45, DS46, DS47, DS48 red) will not be lit. PHY LINK LED (DS02, DS03, DS14 green) should be lit if the Ethernet is connected.

Following are several basic system initializations.

Basic DS33Z44 Initialization (Used for All Quick Setups)

This section covers four basic methods for configuring the Z44. Any one of these initializations can be used with the following Quick Setup examples:

1. Upon power-up, the on-board device driver provides a basic configuration for the DS33Z44 and attached serial cards. This enables traffic to pass from the Ethernet port to the serial port. Consult the device driver documentation for further details. Device driver behavior is dependant upon jumper settings, which are detailed in Table 2.
2. Register-Based Configuration. Launch ChipView.exe and select *Register View*. When prompted for a definition file, pick the file named **DS33Z44.def**. After the definition file loads, go to the File menu and select *File→Memory Config File→Load .MFG file*. When prompted, select the file named **4Portsbasic_config.mfg**.
3. Hardware Mode. Set switches as described in the section for powering up the design kit, then change the following: HWMODE←3.3V, A0←3.3VV, A1←3.3V, A2←0V. This sets the part for LSB first, scrambling off, HDLC encapsulated. At this point traffic will pass from the Ethernet port to the serial port. In this mode broadcast frames are not passed (i.e., ping).
4. EEPROM mode is available with the DK, but is beyond the scope of this manual.

Quick Setup #1 (Device Driver + CPLD Loopback)

- On the serial resource card install jumper 24. Jumpers JP16–JP19 should be set high. This places the card in CPLD loopback and enables all four ports as described in [Table 3](#).
- Complete the hardware configuration and one of the basic DS33Z44 configurations as described in the previous section.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- At this point any packets sent to the DS33Z44 are echoed back. Incoming packets (i.e., ping) should cause the RX LED to blink, after which the TX LED should also blink.
- To interact with the device driver select from the drop down menu:
 - Tools→Plugins→Load Plugins. When asked if DLLs have already registered select yes
 - Select Tools→Plugins→DS33Z44/11/41 Device Driver Demo
 - A new form called 'Zchip Configuration' pops up.
 - Preload basic configuration for the GUI by selecting File→Load Settings (in the 'Zchip Configuration' form). Select the file named 'basic_Config.eset'

Quick Setup #2 (DS3174 T3E3)

- On the DS3174 serial resource card install jumper J24. Jumpers JP16–JP19 should be set high. This places the card in DS3174 mode and enables all four ports as described in [Table 3](#).
- Complete the hardware configuration and one of the basic DS33Z44 configurations as previously described.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- Launch ChipView.exe (or use existing session if it is already open) and select *Register View*. When prompted for a definition file, pick the file name **ds3184_evbrd_reduced.def**. After the definition file loads, go to the File menu and select File→Memory Config File→Load .MFG file. When prompted, select the file named **84_t3_sct_needscoaxlb.mfg**.
- Place a loopback connector at the DS3174 network side.
- At this point, any packets sent to the DS33Z44 are echoed back. Incoming packets (i.e., ping) should cause the RX LED to blink, after which the TX LED should also blink.

Quick Setup #3 (DS21458 T1E1)

- Complete the hardware configuration and one of the basic DS33Z44 configurations as previously described.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- Launch ChipView.exe (or use existing session if it is already open) and select *Register View*. When prompted for a definition file, pick the file named **DS21458.def**. After the definition file loads, go to the File menu and select File→Reg Ini File→Load Ini File. When prompted, pick the file named **e1_gapclk_crc4_hdb3_nocas.ini**.
- Place a loopback connector at the DS21458 network side; RLOS LED should go out.
- At this point any packets sent to the DS33Z44 are echoed back. Incoming packets (i.e. ping) should cause the RX LED to blink, after which the TX LED should also blink.

CONFIGURATION SWITCHES AND JUMPERS

The DS33Z44DK has several configuration switches, banana plugs, oscillators, and jumpers. [Table 2](#) provides a description of these signals, given in order of appearance on the PC board (going from left to right, top to bottom).

Table 2. Main Board PC Board Configuration

SILKSCREEN REFERENCE	FUNCTION	BASIC SETTING		DESCRIPTION
		SW MODE	HW MODE	
J25.9 + J25.10	Reserved	Not Installed	—	This jumper is not for use with the DS33Z44 design kit. Pin J25.10 has been removed to prevent accidental installation.
J25.7 + J25.8	Enable device driver	User decision	—	When installed the device driver will configure the DS33Z44 and the Transceiver during power-up.
J25.5 + J25.6	Enable callbacks	User decision	—	When installed the driver will respond to interrupts.
GROUND (banana plug)	Power supply ground	—	—	System Ground. Always connected to power supply.
VDD 3.3V (banana plug)	Power supply VDD	—	—	System VDD. Always connected to power supply.
OnCe	BDM	—	—	Debug connector for processor
DCEDTES (3pos switch)	DS33Z44 mode pin; DTE/DCE selection	Low	Low	Low for DTE
RMIIMII (3pos switch)	DS33Z44 mode pin	Low	Low	High for RMII, low for MII
CKPHA (3pos switch)	DS33Z44 mode pin	Low	Low	SPI EEPROM hardware mode configuration switch
MODEC0 (3pos switch)	DS33Z44 mode pin	High	Low	Software mode selected
MODEC1 (3pos switch)	DS33Z44 mode pin	Low	Low	Software mode selected
HWMODE (3pos switch)	DS33Z44 mode pin	Low	Low	Hardware/software mode (software mode selected)
SCANMO (3pos switch)	DS33Z44 mode pin	Low	Low	Set low for normal operation
SCANTRI (3pos switch)	DS33Z44 mode pin	Low	Low	Set low for normal operation
....testpoints....	DS33Z44 testpoints	—	—	Processor bus, JTAG and LAN side testpoints for Zchip
Z-RESET (button)	DS33Z44 reset	—	—	System reset
A2, A1, A0 (3pos switches)	DS33Z44/SPI pins	Mid position	Mid position	Address pin/EEPROM config switch. Set to mid position to allow connection to processor.
SDRAM CLOCK	DS33Z44 SDRAM clock	Installed	Installed	100MHz oscillator to drive SDRAM clock
MII CLOCK	PHY MII clock	Installed	Installed	25MHz oscillator to drive SDRAM clock
spi_cs, spi_ck, spi_miso, spi_mosi	—	—	—	SPI signals (for EEPROM memory)
....testpoints.....	DS33Z44 testpoints	—	—	DS33Z44 serial port testpoints
AFCS (1 per port)	DS33Z44 mode pin	HW mode only	High	Set high to enable auto flow control.

SILKSCREEN REFERENCE	FUNCTION	BASIC SETTING		DESCRIPTION
		SW MODE	HW MODE	
FULLDS (1 per port)	DS33Z44 mode pin	HW mode only	High	Set high to enable full duplex.
H10S (1 per port)	DS33Z44 mode pin	HW mode only	High	Set high to config for 100Mb.
GROUND/VDD (banana plug)	Power supply ground/3.3V	—	—	Redundant connection to system power. Use plugs at either top or bottom of board.
VDD 3.3V (banana plug)	Power supply VDD	—	—	Redundant connection to system power. Use plugs at either top or bottom of board.

Table 3. DS3174 Serial Reference Card Jumper Settings

JUMPER SETTINGS	MODE	COMMENT
JP16	Port 4 tri-state (at CPLD)	When the middle pin of this 3 position jumper is set to VCC, the CPLD passes traffic from the DS3174 to the DS33Z44. When the pin is set low, the CPLD tri-states this port.
JP17	Port 2 tri-state (at CPLD)	When the middle pin of this 3 position jumper is set to VCC, the CPLD passes traffic from the DS3174 to the DS33Z44. When the pin is set low, the CPLD tri-states this port.
JP18	Port 3 tri-state (at CPLD)	When the middle pin of this 3 position jumper is set to VCC, the CPLD passes traffic from the DS3174 to the DS33Z44. When the pin is set low, the CPLD tri-states this port.
JP19	Port 1 tri-state (at CPLD)	When the middle pin of this 3 position jumper is set to VCC, the CPLD passes traffic from the DS3174 to the DS33Z44. When the pin is set low, the CPLD tri-states this port.
J243	CPLD loopback	CPLD loopback makes the following connections: Zrser ← Ztser, Ztden ← 3.3V, Zrden ← 3.3V, Ztclki ← OscY03, Zrclki ← OscY03

ADDRESS MAP (ALL CARDS)

Motorola resource card address space begins at 0x81000000. All offsets given below are relative to the beginning of the daughter card address space (shown previously).

Table 4. Overview of Daughter Card Address Map

OFFSET	DEVICE	DESCRIPTION
0X0000 to 0X0087	FPGA	Processor board identification
0X1000 to 0X1FFF	DS33Z44	DS33Z44. Uses CS_X1.
0X2000 to 0X2FFF	DS21458	T1E1 DS21458 resource card. Uses CS_X2.
0X4000 to 0X4010	FPGA	FPGA on DS21458 resource card. Used to facilitate IBO mode. Default configuration of FPGA is compatible with non-IBO mode functionality. The FPGA settings do not require modification for use with the DS33Z44.
0X3000 to 0X3FFF	DS3174	T3E3 resource card. Uses CS_X3.

Registers in the DS33Z44, DS21458, and DS3174 can be easily modified using the ChipView host-based user-interface software with the definition files previously mentioned.

DS33Z44 INFORMATION

For more information about the DS33Z44, consult the DS33Z44 data sheet available on our website at www.maxim-ic.com/DS33Z44.

DS33Z44DK INFORMATION

For more information about the DS33Z44DK, including software downloads, consult the DS33Z44DK data sheet available on the our website at www.maxim-ic.com/DS33Z44DK.

DOCUMENT REVISION HISTORY

REVISION DATE	DESCRIPTION
032305	Initial DS33Z44DK data sheet release.
042205	Updated <i>Basic DS33Z44 Initialization</i> section; added step to <i>Quick Setup #1</i> .
051105	Added new PC board errata.
110106	Updated schematics.

SCHEMATICS

The DS33Z44DK schematics are featured in the following pages. As this is a hierarchal schematic some explanation is in order. The main board is composed of six hierarchal blocks: the processor block, the DS33Z44 block, and four Ethernet blocks inside the DS33Z44 block, which is a nested hierarchy block. Each serial card (DS21458 and DS3174) consists of a single hierarchy block, which connects to a 140-pin AV bus that snaps into the mainboard.

All signals inside a hierarchy block are local, with exception for V_{CC} and ground. In-port and out-port connectors are used to allow signals inside a hierarchy block to become accessible as pins on the hierarchy blocks symbol. From here, blocks are wired together as if they were ordinary components. The system diagram is shown again below, with schematic page numbers given for each functional block.

This system contained other hierarchy blocks that are not shown (primarily a single-port serial card and the DS33Z11 mainboard). Due to this, page numbers will not be continuous and some gaps in numbering will be seen when referring to the total page count. However, page numbers inside any given hierarchy block will be continuous.
