**DW SUFFIX**  
PLASTIC PACKAGE  
CASE 751D  
(SO-20L)

The diagram shows the internal architecture of the IC10100 receiver chip. Key components include:

- Crystal Osc.:** Pins 1 and 2 are connected to a crystal oscillator.
- Oscillator:** Receives input from the crystal oscillator and outputs to the Mixer.
- Mixer:** Receives input from the Oscillator and outputs to the Broadcast Detector.
- Broadcast Detector:** Receives input from the Mixer and outputs to the Audio Mute (pin 16) and the Scan Control (pin 15).
- Limiter:** Receives input from the Mixer and outputs to the Broadcast Detector. It includes a 1.8 kΩ resistor and a 52 kΩ resistor.
- Demodulator:** Receives input from the Broadcast Detector and outputs to the Demod Output (pin 11).
- Recovered Audio:** Output from the Demodulator, connected to pin 10.
- Other pins:** Pin 3 is Mixer Output, pin 4 is V<sub>CC</sub>, pin 5 is Limiter Input, pin 6 is Decoupling, pin 7 is Decoupling, pin 8 is Quadrature Input, pin 9 is Demodulator Filter, pin 12 is Filter Input, pin 13 is Filter Output, pin 14 is Squelch Input, and pin 17 is Gnd.

Pinout diagram for the MC3359DW integrated circuit. The chip is labeled "MC3359DW" and "CASE 751D". A black dot is shown at pin 1.

MC3359

## CIRCUIT DESCRIPTION

The MC3359 is a low-power FM IF circuit designed primarily for use in voice-communication scanning receivers. It is also finding a place in narrowband data links.

In the typical application (Figure 1), the mixer-oscillator combination converts the input frequency (10.7 MHz) down to 455 kHz, where, after external bandpass filtering, most of the amplification is done. The audio is recovered using a conventional quadrature FM detector. The absence of an input signal is indicated by the presence of noise above the desired audio frequencies. This "noise band" is monitored by an active filter and a detector. A squelch-trigger circuit indicates the presence of noise (or a tone) by an output which can be used to control scanning. At the same time, an internal switch is operated which can be used to mute the audio.

## APPLICATIONS INFORMATION

The oscillator is an internally biased Colpitts type with the collector, base, and emitter connections at Pin 4, 1 and 2, respectively. The crystal is used in fundamental mode, calibrated for parallel resonance at 32 pF load capacitance. In theory this means that the two capacitors in series should be 32 pF, but in fact much larger values do not significantly affect the oscillator frequency, and provide higher oscillator output.

The oscillator can also be used in the conventional L/C Colpitts configuration without loss of mixer conversion gain. This oscillator is, of course, much more sensitive to voltage and temperature as shown in Figure 12. Guidelines for choosing L and C values are given in Figure 14.

The mixer is doubly balanced to reduce spurious responses. The mixer measurements of Figure 4 and 6 were made using an external 50  $\Omega$  source and the internal 1.8 k at Pin 3. Voltage gain curves at several  $V_{CC}$  voltages are shown in Figure 4. The Third Order Intercept curves of Figure 6 are shown using the conventional dBm scales. Measured power gain (with the 50  $\Omega$  input) is approximately 18 dB but the useful gain is much higher because the mixer input impedance is over 3 k $\Omega$ . Most applications will use a 330  $\Omega$  10.7 MHz crystal filter ahead of the mixer. For higher frequencies, the relative mixer gain is given in Figure 8.

Following the mixer, a ceramic bandpass filter is recommended. The 455 kHz types come in bandwidths from  $\pm 2$  kHz to  $\pm 15$  kHz and have input and output impedances of 1.5 k to 2.0 k. For this reason, the Pin 5 input to the 6 stage limiting IF has an internal 1.8 k resistor. The IF has a 3 dB

limiting sensitivity of approximately 100  $\mu$ V at Pin 5 and a useful frequency range of about 5 MHz as shown in Figure 5. The frequency limitation is due to the high resistance values in the IF, which were necessary to meet the low power requirement. The output of the limiter is internally connected to the quadrature detector, including the 10 pF quadrature capacitor. Only a parallel L/C is needed externally from Pin 8 to  $V_{CC}$ . A shunt resistance can be added to widen the peak separation of the quadrature detector.

The detector output is amplified and buffered to the audio output, Pin 10, which has an output impedance of approximately 300  $\Omega$ . Pin 9 provides a high impedance (50 k) point in the output amplifier for application of a filter or de-emphasis capacitor. Pin 11 is the AFC output, with high gain and high output impedance (1 M). If not needed, it should be grounded, or it can be connected to Pin 9 to double the recovered audio. The detector and AFC responses are shown in Figure 7.

Overall performance of the MC3359 from mixer input to audio output is shown in Figure 9 and 10. The MC3359 can also be operated in "single conversion" equipment; i.e., the mixer can be used as a 455 kHz amplifier. The oscillator is disabled by connecting Pin 1 to Pin 2. In this mode, the overall performance is identical to the 10.7 MHz results of Figure 9.

A simple inverting op amp is provided with an output at Pin 13 providing dc bias (externally) to the input at Pin 12, which is referred internally to 2.0 V. A filter can be made with external impedance elements to discriminate between frequencies. With an external AM detector, the filtered audio signal can be checked for the presence of either noise above the normal audio, or a tone signal.

The open loop response of this op amp is given in Figure 13. Bandpass filter design information is provided in Figure 15.

A low bias to Pin 14 sets up the squelch-trigger circuit so that Pin 15 is high, a source of at least 2.0 mA, and the audio mute (Pin 16) is open-circuit. If Pin 14 is raised to 0.7 V by the noise or tone detector, Pin 15 becomes open circuit and Pin 16 is internally short circuited to ground. There is no hysteresis. Audio muting is accomplished by connecting Pin 16 to a high-impedance ground-reference point in the audio path between Pin 10 and the audio amplifier. No dc voltage is needed, in fact it is not desirable because audio "thump" would result during the muting function. Signal swing greater than 0.7 V below ground on Pin 16 should be avoided.

# MC3359

## OUTLINE DIMENSIONS

### P SUFFIX PLASTIC PACKAGE CASE 707-02 ISSUE C

#### NOTES:

1. POSITIONAL TOLERANCE OF LEADS (D), SHALL BE WITHIN 0.25 (0.010) AT MAXIMUM MATERIAL CONDITION, IN RELATION TO SEATING PLANE AND EACH OTHER.
2. DIMENSION L TO CENTER OF LEADS WHEN FORMED PARALLEL.
3. DIMENSION B DOES NOT INCLUDE MOLD FLASH.
