

CMOS Static RAM 256K (32K x 8-Bit)

IDT71256S
IDT71256L

Features

- ♦ High-speed address/chip select time
 - Military: 25/35/45/55/70/85/100ns (max.)
 - Industrial: 25/35ns (max.)
 - Commercial: 20/25/35ns (max.) low power only
- ♦ Low-power operation
- ♦ Battery Backup operation – 2V data retention
- ♦ Produced with advanced high-performance CMOS technology
- ♦ Input and output directly TTL-compatible
- ♦ Available in standard 28-pin (300 or 600 mil) ceramic DIP, 28-pin (600 mil) plastic DIP, 28-pin (300 mil) SOJ and 32-pin LCC
- ♦ Military product compliant to MIL-STD-883, Class B

Description

The IDT 71256 is a 262,144-bit high-speed static RAM organized as 32K x 8. It is fabricated using IDT's high-performance, high-reliability CMOS technology.

Address access times as fast as 20ns are available with power consumption of only 350mW (typ.). The circuit also offers a reduced power standby mode. When $\overline{CS}$ goes HIGH, the circuit will automatically go to and remain in, a low-power standby mode as long as $\overline{CS}$ remains HIGH. In the full standby mode, the low-power device consumes less than 15 μ W, typically. This capability provides significant system level power and cooling savings. The low-power (L) version also offers a battery backup data retention capability where the circuit typically consumes only 5 μ W when operating off a 2V battery.

The IDT71256 is packaged in a 28-pin (300 or 600 mil) ceramic DIP, a 28-pin 300 mil SOJ, a 28-pin (600 mil) plastic DIP, and a 32-pin LCC providing high board level packing densities.

The IDT71256 military RAM is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

NOTE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

2946 drw 08

Timing Waveform of Read Cycle No. 2^(1,3,4)

2946 drw 09

NOTES:

1. $\overline{WE}$ is HIGH for Read Cycle.
2. Device is continuously selected, $\overline{CS}$ is LOW.
3. Address valid prior to or coincident with $\overline{CS}$ transition LOW.
4. $\overline{OE}$ is LOW.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 1 ($\overline{WE}$ Controlled Timing)^(1,2,4,6)

2946 drw 10

Timing Waveform of Write Cycle No. 2 ($\overline{CS}$ Controlled Timing)^(1,2,4)

2946 drw 11

NOTES:

1. A write occurs during the overlap of a LOW $\overline{CS}$ and a LOW $\overline{WE}$.
2. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going HIGH to the end of the write cycle.
3. During this period, I/O pins are in the output state so that the input signals must not be applied.
4. If the $\overline{CS}$ LOW transition occurs simultaneously with or after the $\overline{WE}$ LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured $\pm 200\text{mV}$ from steady state.
6. If $\overline{OE}$ is LOW during a $\overline{WE}$ controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WHZ} + t_{OW})$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{OW} . If $\overline{OE}$ is HIGH during a $\overline{WE}$ controlled write cycle, this requirement does not apply and the minimum write pulse width can be as short as the specified t_{WP} . For a $\overline{CS}$ controlled write cycle, $\overline{OE}$ may be LOW with no degradation to t_{CW} .
