Digital Signal Processors***

***Data Manual***

Literature Number: SGUS051A  
March 2004 – Revised October 2004

This document contains information on products in more than one phase of development. The status of each device is indicated on the page(s) specifying its electrical characteristics.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

## 1 Features

- Controlled Baseline
  - One Assembly/Test/Fabrication Site
- Extended Temperature Performance of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$
- Enhanced Diminishing Manufacturing Sources (DMS) Support
- Enhanced Product-Change Notification
- Qualification Pedigree<sup>†</sup>
- High-Performance Static CMOS Technology
  - 150 MHz (6.67-ns Cycle Time)
  - Low-Power (1.8-V Core @ 135 MHz, 1.9-V Core @ 150 MHz, 3.3-V I/O) Design
- JTAG Boundary Scan Support<sup>‡</sup>
- High-Performance 32-Bit CPU (320C28x)
  - 16 x 16 and 32 x 32 MAC Operations
  - 16 x 16 Dual MAC
  - Harvard Bus Architecture
  - Atomic Operations
  - Fast Interrupt Response and Processing
  - Unified Memory Programming Model
  - 4M Linear Program/Data Address Reach
  - Code-Efficient (in C/C++ and Assembly)
  - 320F24x/LF240x Processor Source Code Compatible
- On-Chip Memory
  - Flash Devices: Up to 128K x 16 Flash (Four 8K x 16 and Six 16K x 16 Sectors)
  - ROM Devices: Up to 128K x 16 ROM
  - 1K x 16 OTP ROM
  - L0 and L1: 2 Blocks of 4K x 16 Each Single-Access RAM (SARAM)
  - H0: 1 Block of 8K x 16 SARAM
  - M0 and M1: 2 Blocks of 1K x 16 Each SARAM
- Boot ROM (4K x 16)
  - With Software Boot Modes
  - Standard Math Tables
- External Interface (2812)
  - Up to 1M Total Memory
  - Programmable Wait States
  - Programmable Read/Write Strobe Timing
  - Three Individual Chip Selects
- Clock and System Control
  - Dynamic PLL Ratio Changes Supported
  - On-Chip Oscillator
  - Watchdog Timer Module
- Three External Interrupts
- Peripheral Interrupt Expansion (PIE) Block That Supports 45 Peripheral Interrupts
- Three 32-Bit CPU-Timers
- 128-Bit Security Key/Lock
  - Protects Flash/ROM/OTP and L0/L1 SARAM
  - Prevents Firmware Reverse Engineering
- Motor Control Peripherals
  - Two Event Managers (EVA, EVB)
  - Compatible to 240xA Devices
- Serial Port Peripherals
  - Serial Peripheral Interface (SPI)
  - Two Serial Communications Interfaces (SCIs), Standard UART
  - Enhanced Controller Area Network (eCAN)
  - Multichannel Buffered Serial Port (McBSP)
- 12-Bit ADC, 16 Channels
  - 2 x 8 Channel Input Multiplexer
  - Two Sample-and-Hold
  - Single/Simultaneous Conversions
  - Fast Conversion Rate: 80 ns/12.5 MSPS
- Up to 56 General Purpose I/O (GPIO) Pins
- Advanced Emulation Features
  - Analysis and Breakpoint Functions
  - Real-Time Debug via Hardware
- Development Tools Include
  - ANSI C/C++ Compiler/Assembler/Linker
  - Code Composer Studio™ IDE
  - DSP/BIOS™
- Low-Power Modes and Power Savings
  - IDLE, STANDBY, HALT Modes Supported
  - Disable Individual Peripheral Clocks
- Package Options
  - 179-Ball MicroStar BGA™ (GHH), (2812)
  - 176-Pin Low-Profile Quad Flatpack (LQFP) (PGF) (2812)

TMS320C24x, Code Composer Studio, DSP/BIOS, and MicroStar BGA are trademarks of Texas Instruments.

<sup>†</sup> Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range.

This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

<sup>‡</sup> IEEE Standard 1149.1-1990, IEEE Standard Test-Access Port

## 2 Introduction

This section provides a summary of each device's features, lists the pin assignments, and describes the function of each pin. This document also provides detailed descriptions of peripherals, electrical specifications, parameter measurement information, and mechanical data about the available packaging.

### 2.1 Description

The SM320F2810-EP, SM320F2811-EP, SM320F2812-EP, SM320C2810-EP, SM320C2811-EP, and SM320C2812-EP devices, members of the TMS320C28x™ DSP generation, are highly integrated, high-performance solutions for demanding control applications. The functional blocks and the memory maps are described in Section 3, Functional Overview.

Throughout this document, SM320F2810-EP, SM320F2811-EP, and SM320F2812-EP are abbreviated as F2810, F2811, and F2812, respectively. F281x denotes all three Flash devices. SM320C2810-EP, SM320C2811-EP, and SM320C2812-EP are abbreviated as C2810, C2811, and C2812, respectively. C281x denotes all three ROM devices. 2810 denotes both F2810 and C2810 devices; 2811 denotes both F2811 and C2811 devices; and 2812 denotes both F2812 and C2812 devices.

<sup>†</sup> The TMS320F2810, TMS320F2811, and TMS320F2812 Digital Signal Processors Silicon Errata (literature number SPRZ193) has been posted on the Texas Instruments (TI) website. It will be updated as needed.

<sup>‡</sup> On C281x devices, OTP is replaced by a 1K X 16 block of ROM.

<sup>§</sup> M stands for -55°C to 125°C military range.

<sup>¶</sup> See Section 5.1, Device and Development Support Nomenclature for descriptions of TMS and TMX stages.

<sup>#</sup> PP: Product Preview. Electrical specifications of F2810/11/12 devices are to be considered as advance information for C2810/11/12 devices.

<sup>||</sup> TMX: The status of each device is indicated on the page(s) specifying its electrical characteristics and is not necessarily representative of the final device's electrical specifications.

## 2.3 Pin Assignments

Figure 2–1 illustrates the ball locations for the 179-ball GHH ball grid array (BGA) package. Figure 2–2 shows the pin assignments for the 176-pin PGF low-profile quad flatpack (LQFP) and Figure 2–3 shows the pin assignments for the 128-pin PBK LQFP. Table 2–2 describes the function(s) of each pin.

### 2.3.1 Terminal Assignments for the GHH Package

See Table 2–2 for a description of each terminal's function(s).

Figure 2–1. 320F2812 and 320C2812 179-Ball GHH MicroStar BGA™ (Bottom View)

### 2.3.2 Pin Assignments for the PGF Package

The 320F2812 and 320C2812 176-pin PGF low-profile quad flatpack (LQFP) pin assignments are shown in Figure 2–2. See Table 2–2 for a description of each pin’s function(s).

Figure 2–2. 320F2812 and 320C2812 176-Pin PGF LQFP (Top View)

### 2.3.3 Pin Assignments for the PBK Package

The 320F2810, 320F2811, 320C2810, and 320C2811 128-pin PBK low-profile quad flatpack (LQFP) pin assignments are shown in Figure 2–3. See Table 2–2 for a description of each pin's function(s).

Figure 2–3. 320F2810, 320F2811, 320C2810, and 320C2811 128-Pin PBK LQFP (Top View)

## 2.4 Signal Descriptions

Table 2–2 specifies the signals on the F281x and C281x devices. All digital inputs are TTL-compatible. All outputs are 3.3 V with CMOS levels. Inputs are not 5-V tolerant. A 100- $\mu$ A (or 20- $\mu$ A) pullup/pulldown is used.

<sup>†</sup> Typical drive strength of the output buffer for all pins is 4 mA except for TDO, XCLKOUT, XF, XINTF, EMU0, and EMU1 pins, which are 8 mA.

<sup>‡</sup> I = Input, O = Output, Z = High impedance

<sup>§</sup> PU = pin has internal pullup; PD = pin has internal pulldown

Table 2-2. Signal Descriptions<sup>†</sup> (Continued)

NAME	PIN NO.			I/O/Z <sup>‡</sup>	PU/PD <sup>§</sup>	DESCRIPTION
	179-PIN GHH	176-PIN PGF	128-PIN PBK			
XINTF SIGNALS (2812 ONLY) (CONTINUED)						
XMP/MC	F1	17	—	I	PD	Microprocessor/Microcomputer Mode Select. Switches between microprocessor and microcomputer mode. When high, Zone 7 is enabled on the external interface. When low, Zone 7 is disabled from the external interface, and on-chip boot ROM may be accessed instead. This signal is latched into the XINTCNF2 register on a reset and the user can modify this bit in software. The state of the XMP/MC pin is ignored after reset.
XHOLD	E7	159	—	I	PU	External Hold Request. <u>XHOLD</u> , when active (low), requests the XINTF to release the external bus and place all buses and strobes into a high-impedance state. The XINTF will release the bus when any current access is complete and there are no pending accesses on the XINTF.
XHOLDA	K10	82	—	O/Z	—	External Hold Acknowledge. <u>XHOLDA</u> is driven active (low) when the XINTF has granted a <u>XHOLD</u> request. All XINTF buses and strobe signals will be in a high-impedance state. XHOLDA is released when the XHOLD signal is released. External devices should only drive the external bus when XHOLDA is active (low).
XZCS0AND1	P1	44	—	O/Z	—	XINTF Zone 0 and Zone 1 Chip Select. <u>XZCS0AND1</u> is active (low) when an access to the XINTF Zone 0 or Zone 1 is performed.
XZCS2	P13	88	—	O/Z	—	XINTF Zone 2 Chip Select. <u>XZCS2</u> is active (low) when an access to the XINTF Zone 2 is performed.
XZCS6AND7	B13	133	—	O/Z	—	XINTF Zone 6 and Zone 7 Chip Select. <u>XZCS6AND7</u> is active (low) when an access to the XINTF Zone 6 or Zone 7 is performed.
XWE	N11	84	—	O/Z	—	Write Enable. Active-low write strobe. The write strobe waveform is specified, per zone basis, by the Lead, Active, and Trail periods in the XTIMINGx registers.
XRD	M3	42	—	O/Z	—	Read Enable. Active-low read strobe. The read strobe waveform is specified, per zone basis, by the Lead, Active, and Trail periods in the XTIMINGx registers. NOTE: The XRD and XWE signals are mutually exclusive.
XR/W	N4	51	—	O/Z	—	Read Not Write Strobe. Normally held high. When low, XR/W indicates write cycle is active; when high, XR/W indicates read cycle is active.

<sup>†</sup> Typical drive strength of the output buffer for all pins is 4 mA except for TDO, XCLKOUT, XF, XINTF, EMU0, and EMU1 pins, which are 8 mA.

<sup>‡</sup> I = Input, O = Output, Z = High impedance

<sup>§</sup> PU = pin has internal pullup; PD = pin has internal pulldown

Table 2-2. Signal Descriptions<sup>†</sup> (Continued)

NAME	PIN NO.			I/O/Z <sup>‡</sup>	PU/PD <sup>§</sup>	DESCRIPTION
	179-PIN GHH	176-PIN PGF	128-PIN PBK			
<b>XINTF SIGNALS (2812 ONLY) (CONTINUED)</b>						
XREADY	B6	161	—	I	PU	Ready Signal. Indicates peripheral is ready to complete the access when asserted to 1. XREADY can be configured to be a synchronous or an asynchronous input. See the timing diagrams for more details.
<b>JTAG AND MISCELLANEOUS SIGNALS</b>						
X1/XCLKIN	K9	77	58	I		Oscillator Input – input to the internal oscillator. This pin is also used to feed an external clock. The 28x can be operated with an external clock source, provided that the proper voltage levels be driven on the X1/XCLKIN pin. It should be noted that the X1/XCLKIN pin is referenced to the 1.8-V (or 1.9-V) core digital power supply ( $V_{DD}$ ), rather than the 3.3-V I/O supply ( $V_{DDIO}$ ). A clamping diode may be used to clamp a buffered clock signal to ensure that the logic-high level does not exceed $V_{DD}$ (1.8 V or 1.9 V) or a 1.8-V oscillator may be used.
X2	M9	76	57	O		Oscillator Output
XCLKOUT	F11	119	87	O	—	Output clock derived from SYSCLKOUT to be used for external wait-state generation and as a general-purpose clock source. XCLKOUT is either the same frequency, 1/2 the frequency, or 1/4 the frequency of SYSCLKOUT. At reset, XCLKOUT = SYSCLKOUT/4. The XCLKOUT signal can be turned off by setting bit 3 (CLKOFF) of the XINTCNF2 register to 1.
TESTSEL	A13	134	97	I	PD	Test Pin. Reserved for TI. Must be connected to ground.
XRS	D6	160	113	I/O	PU	<p>Device Reset (in) and Watchdog Reset (out).</p> <p>Device reset. <math>\overline{XRS}</math> causes the device to terminate execution. The PC will point to the address contained at the location 0x3FFFC0. When <math>\overline{XRS}</math> is brought to a high level, execution begins at the location pointed to by the PC. This pin is driven low by the DSP when a watchdog reset occurs. During watchdog reset, the XRS pin will be driven low for the watchdog reset duration of 512 XCLKIN cycles.</p> <p>The output buffer of this pin is an open-drain with an internal pullup (100 <math>\mu</math>A, typical). It is recommended that this pin be driven by an open-drain device.</p>
TEST1	M7	67	51	I/O	—	Test Pin. Reserved for TI. On F281x devices, TEST1 must be left unconnected. On C281x devices, this pin is a “no connect (NC)” (i.e., this pin is not connected to any circuitry internal to the device).
TEST2	N7	66	50	I/O	—	Test Pin. Reserved for TI. On F281x devices, TEST2 must be left unconnected. On C281x devices, this pin is a “no connect (NC)” (i.e., this pin is not connected to any circuitry internal to the device).

<sup>†</sup> Typical drive strength of the output buffer for all pins is 4 mA except for TDO, XCLKOUT, XF, XINTF, EMU0, and EMU1 pins, which are 8 mA.

<sup>‡</sup> I = Input, O = Output, Z = High impedance

<sup>§</sup> PU = pin has internal pullup; PD = pin has internal pulldown

Table 2-2. Signal Descriptions<sup>†</sup> (Continued)

NAME	PIN NO.			I/O/Z <sup>‡</sup>	PU/PD <sup>§</sup>	DESCRIPTION
	179-PIN GHH	176-PIN PGF	128-PIN PBK			
JTAG						
TRST	B12	135	98	I	PD	JTAG test reset with internal pulldown. <u>TRST</u> , when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored.  NOTE: Do not use pullup resistors on <u>TRST</u> ; it has an internal pulldown device. In a low-noise environment, <u>TRST</u> can be left floating. In a high-noise environment, an additional pulldown resistor may be needed. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k $\Omega$ resistor generally offers adequate protection. Since this is application-specific, it is recommended that each target board is validated for proper operation of the debugger and the application.
TCK	A12	136	99	I	PU	JTAG test clock with internal pullup
TMS	D13	126	92	I	PU	JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK.
TDI	C13	131	96	I	PU	JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK.
TDO	D12	127	93	O/Z	-	JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) is shifted out of TDO on the falling edge of TCK.
EMU0	D11	137	100	I/O/Z	PU	Emulator pin 0. When <u>TRST</u> is driven high, this pin is used as an interrupt to or from the emulator system and is defined as input/output through the JTAG scan.
EMU1	C9	146	105	I/O/Z	PU	Emulator pin 1. When <u>TRST</u> is driven high, this pin is used as an interrupt to or from the emulator system and is defined as input/output through the JTAG scan.
ADC ANALOG INPUT SIGNALS						
ADCINA7	B5	167	119	I		8-Channel analog inputs for Sample-and-Hold A. The ADC pins should not be driven before $V_{DDA1}$ , $V_{DDA2}$ , and $V_{DDAIO}$ pins have been fully powered up.
ADCINA6	D5	168	120	I		
ADCINA5	E5	169	121	I		
ADCINA4	A4	170	122	I		
ADCINA3	B4	171	123	I		
ADCINA2	C4	172	124	I		
ADCINA1	D4	173	125	I		
ADCINA0	A3	174	126	I		

<sup>†</sup> Typical drive strength of the output buffer for all pins is 4 mA except for TDO, XCLKOUT, XF, XINTF, EMU0, and EMU1 pins, which are 8 mA.

<sup>‡</sup> I = Input, O = Output, Z = High impedance

<sup>§</sup> PU = pin has internal pullup; PD = pin has internal pulldown

HALT and STANDBY modes cannot be used when the PLL is disabled. 3. GPIO – GPIO function
GPIOG OR SCI-B SIGNALS							
GPIOG4	SCITXDB (O)	P14	90	66	I/O/Z	-	GPIO or SCI asynchronous serial port transmit data
GPIOG5	SCIRXDB (I)	M13	91	67	I/O/Z	-	GPIO or SCI asynchronous serial port receive data

<sup>†</sup> Typical drive strength of the output buffer for all pins [except TDO, XCLKOUT, XF, XINTF, EMU0, and EMU1 pins] is 4 mA typical.

<sup>‡</sup> I = Input, O = Output, Z = High impedance

<sup>§</sup> PU = pin has internal pullup; PD = pin has internal pulldown

**NOTE:**

Other than the power supply pins, no pin should be driven before the 3.3-V rail has reached recommended operating conditions. However, it is acceptable for an I/O pin to ramp along with the 3.3-V supply.

### 3 Functional Overview

<sup>†</sup> 45 of the possible 96 interrupts are used on the devices.

<sup>‡</sup> XINTF is available on the F2812 and C2812 devices only.

<sup>§</sup> On C281x devices, the OTP is replaced with a 1K X 16 block of ROM.

Figure 3–1. Functional Block Diagram

### 3.1 Memory Map

NOTES:

- Memory blocks are not to scale.
- Reserved locations are reserved for future expansion. Application should not access these areas.
- Boot ROM and Zone 7 memory maps are active either in on-chip or XINTF zone depending on MP/MC, not in both.
- Peripheral Frame 0, Peripheral Frame 1, and Peripheral Frame 2 memory maps are restricted to data memory only. User program cannot access these memory maps in program space.
- “Protected” means the order of Write followed by Read operations is preserved rather than the pipeline order.
- Certain memory ranges are EALLOW protected against spurious writes after configuration.
- Zones 0 and 1 and Zones 6 and 7 share the same chip select; hence, these memory blocks have mirrored locations.

Figure 3–2. F2812/C2812 Memory Map (See Notes A through E)

NOTES: A. Memory blocks are not to scale.  
 B. Reserved locations are reserved for future expansion. Application should not access these areas.  
 C. Peripheral Frame 0, Peripheral Frame 1, and Peripheral Frame 2 memory maps are restricted to data memory only. User program cannot access these memory maps in program space.  
 D. “Protected” means the order of Write followed by Read operations is preserved rather than the pipeline order.  
 E. Certain memory ranges are EALLOW protected against spurious writes after configuration.

0x3E C000 0x3E FFFF	Sector D, 16K x 16
0x3F 0000 0x3F 3FFF	Sector C, 16K x 16
0x3F 4000 0x3F 5FFF	Sector B, 8K x 16
0x3F 6000	Sector A, 8K x 16
0x3F 7F80 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 0x3F 7FF7	Boot-to-Flash (or ROM) Entry Point (program branch instruction here)
0x3F 7FF8 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

**Table 3-2. Addresses of Flash Sectors in F2810**

ADDRESS RANGE	PROGRAM AND DATA SPACE
0x3E 8000 0x3E BFFF	Sector E, 16K x 16
0x3E C000 0x3E FFFF	Sector D, 16K x 16
0x3F 0000 0x3F 3FFF	Sector C, 16K x 16
0x3F 4000 0x3F 5FFF	Sector B, 8K x 16
0x3F 6000	Sector A, 8K x 16
0x3F 7F80 0x3F 7FF5	Program to 0x0000 when using the Code Security Module
0x3F 7FF6 0x3F 7FF7	Boot-to-Flash (or ROM) Entry Point (program branch instruction here)
0x3F 7FF8 0x3F 7FFF	Security Password (128-Bit) (Do not program to all zeros)

The “Low 64K” of the memory address range maps into the data space of the 240x. The “High 64K” of the memory address range maps into the program space of the 24x/240x. 24x/240x-compatible code will only execute from the “High 64K” memory area. Hence, the top 32K of Flash/ROM and H0 SARAM block can be used to run 24x/240x-compatible code (if  $\overline{MP/MC}$  mode is low) or, on the 2812, code can be executed from XINTF Zone 7 (if  $\overline{MP/MC}$  mode is high).

The XINTF consists of five independent zones. One zone has its own chip select and the remaining four zones share two chip selects. Each zone can be programmed with its own timing (wait states) and to either sample or ignore external ready signal. This makes interfacing to external peripherals easy and glueless.

**NOTE:**

The chip selects of XINTF Zone 0 and Zone 1 are merged together into a single chip select ( $XZCS0AND1$ ); and the chip selects of XINTF Zone 6 and Zone 7 are merged together into a single chip select ( $\overline{XZCS6AND7}$ ). See Section 3.5, “External Interface, XINTF (2812 only)”, for details.

Peripheral Frame 1, Peripheral Frame 2, and XINTF Zone 1 are grouped together so as to enable these blocks to be “write/read peripheral block protected”. The “protected” mode ensures that all accesses to these blocks happen as written. Because of the C28x pipeline, a write immediately followed by a read, to different memory locations, will appear in reverse order on the memory bus of the CPU. This can cause problems in certain peripheral applications where the user expected the write to occur first (as written). The C28x CPU supports a block protection mode where a region of memory can be protected so as to make sure that operations occur as written (the penalty is extra cycles are added to align the operations). This mode is programmable and by default, it will protect the selected zones.

On the 2812, at reset, XINTF Zone 7 is accessed if the XMP/MC pin is pulled high. This signal selects microprocessor or microcomputer mode of operation. In microprocessor mode, Zone 7 is mapped to high memory such that the vector table is fetched externally. The Boot ROM is disabled in this mode. In microcomputer mode, Zone 7 is disabled such that the vectors are fetched from Boot ROM. This allows the user to either boot from on-chip memory or from off-chip memory. The state of the XMP/MC signal on reset is stored in an MP/MC mode bit in the XINTCNF2 register. The user can change this mode in software and hence control the mapping of Boot ROM and XINTF Zone 7. No other memory blocks are affected by XMP/MC.

I/O space is not supported on the 2812 XINTF.

The wait states for the various spaces in the memory map area are listed in Table 3–3.

**Table 3-3. Wait States**

AREA	WAIT-STATES	COMMENTS
M0 and M1 SARAMs	0-wait	Fixed
Peripheral Frame 0	0-wait	Fixed
Peripheral Frame 1	0-wait (writes) 2-wait (reads)	Fixed
Peripheral Frame 2	0-wait (writes) 2-wait (reads)	Fixed
L0 & L1 SARAMs	0-wait	
OTP (or ROM)	Programmable, 1-wait minimum	Programmed via the Flash registers. 1-wait-state operation is possible at a reduced CPU frequency. See Section 3.2.6, Flash (F281x Only), for more information.
Flash (or ROM)	Programmable, 0-wait minimum	Programmed via the Flash registers. 0-wait-state operation is possible at reduced CPU frequency. The CSM password locations are hardwired for 16 wait-states. See Section 3.2.6, Flash (F281x Only), for more information.
H0 SARAM	0-wait	Fixed
Boot-ROM	1-wait	Fixed
XINTF	Programmable, 1-wait minimum	Programmed via the XINTF registers. Cycles can be extended by external memory or peripheral. 0-wait operation is not possible.

## 3.2 Brief Descriptions

### 3.2.1 C28x CPU

The C28x™ DSP generation is the newest member of the TMS320C2000™ DSP platform. The C28x is source code compatible to the 24x/240x DSP devices, hence existing 240x users can leverage their significant software investment. Additionally, the C28x is a very efficient C/C++ engine, hence enabling users to develop not only their system control software in a high-level language, but also enables math algorithms to be developed using C/C++. The C28x is as efficient in DSP math tasks as it is in system control tasks that typically are handled by microcontroller devices. This efficiency removes the need for a second processor in many systems. The 32 x 32-bit MAC capabilities of the C28x and its 64-bit processing capabilities, enable the C28x to efficiently handle higher numerical resolution problems that would otherwise demand a more expensive floating-point processor solution. Add to this the fast interrupt response with automatic context save of critical registers, resulting in a device that is capable of servicing many asynchronous events with minimal latency. The C28x has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables the C28x to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special store conditional operations further improve performance.

C28x and TMS320C2000 are trademarks of Texas Instruments.

### 3.2.2 Memory Bus (Harvard Bus Architecture)

As with many DSP type devices, multiple busses are used to move data between the memories and peripherals and the CPU. The C28x memory bus architecture contains a program read bus, data read bus and data write bus. The program read bus consists of 22 address lines and 32 data lines. The data read and write busses consist of 32 address lines and 32 data lines each. The 32-bit-wide data busses enable single cycle 32-bit operations. The multiple bus architecture, commonly termed "Harvard Bus", enables the C28x to fetch an instruction, read a data value and write a data value in a single cycle. All peripherals and memories attached to the memory bus will prioritize memory accesses. Generally, the priority of Memory Bus accesses can be summarized as follows:

Highest:	Data Writes <sup>†</sup>
	Program Writes <sup>†</sup>
	Data Reads
	Program Reads <sup>‡</sup>
Lowest:	Fetches <sup>‡</sup>

### 3.2.3 Peripheral Bus

To enable migration of peripherals between various Texas Instruments (TI) DSP family of devices, the F281x and C281x adopt a peripheral bus standard for peripheral interconnect. The peripheral bus bridge multiplexes the various busses that make up the processor "Memory Bus" into a single bus consisting of 16 address lines and 16 or 32 data lines and associated control signals. Two versions of the peripheral bus are supported on the F281x and C281x. One version only supports 16-bit accesses (called peripheral frame 2) and this retains compatibility with C240x-compatible peripherals. The other version supports both 16- and 32-bit accesses (called peripheral frame 1).

### 3.2.4 Real-Time JTAG and Analysis

The F281x and C281x implement the standard IEEE 1149.1 JTAG interface. Additionally, the F281x and C281x support real-time mode of operation whereby the contents of memory, peripheral and register locations can be modified while the processor is running and executing code and servicing interrupts. The user can also single step through non-time critical code while enabling time-critical interrupts to be serviced without interference. The F281x and C281x implement the real-time mode in hardware within the CPU. This is a unique feature to the F281x and C281x, no software monitor is required. Additionally, special analysis hardware is provided which allows the user to set hardware breakpoint or data/address watch-points and generate various user selectable break events when a match occurs.

### 3.2.5 External Interface (XINTF) (2812 Only)

This asynchronous interface consists of 19 address lines, 16 data lines, and three chip-select lines. The chip-select lines are mapped to five external zones, Zones 0, 1, 2, 6, and 7. Zones 0 and 1 share a single chip-select; Zones 6 and 7 also share a single chip-select. Each of the five zones can be programmed with a different number of wait states, strobe signal setup and hold timing and each zone can be programmed for extending wait states externally or not. The programmable wait-state, chip-select and programmable strobe timing enables glueless interface to external memories and peripherals.

<sup>†</sup> Simultaneous Data and Program writes cannot occur on the Memory Bus.

<sup>‡</sup> Simultaneous Program Reads and Fetches cannot occur on the Memory Bus.

### 3.2.6 Flash (F281x Only)

The F2812 and F2811 contain 128K x 16 of embedded flash memory, segregated into four 8K X 16 sectors, and six 16K X 16 sectors. The F2810 has 64K X 16 of embedded flash, segregated into two 8K X 16 sectors, and three 16K X 16 sectors. All three devices also contain a single 1K x 16 of OTP memory at address range 0x3D 7800 – 0x3D 7BFF. The user can individually erase, program, and validate a flash sector while leaving other sectors untouched. However, it is not possible to use one sector of the flash or the OTP to execute flash algorithms that erase/program other sectors. Special memory pipelining is provided to enable the flash module to achieve higher performance. The flash/OTP is mapped to both program and data space; therefore, it can be used to execute code or store data information.

**NOTE:**

The F2810/F2811/F2812 Flash and OTP wait states can be configured by the application. This allows applications running at slower frequencies to configure the flash to use fewer wait states.

Flash effective performance can be improved by enabling the flash pipeline mode in the Flash options register. With this mode enabled, effective performance of linear code execution will be much faster than the raw performance indicated by the wait state configuration alone. The exact performance gain when using the Flash pipeline mode is application-dependent. The pipeline mode is not available for the OTP block.

For more information on the Flash options, Flash wait-state, and OTP wait-state registers, see the *TMS320F28x System Control and Interrupts Reference Guide* (literature number SPRU078).

### 3.2.7 ROM (C281x Only)

The C2812 and C2811 contain 128K x 16 of ROM. The C2810 has 64K x 16 of ROM. In addition to this, there is a 1K X 16 ROM block that replaces the OTP memory available in flash devices. For information on how to submit ROM codes to TI, see the *TMS320C28x CPU and Instruction Set Reference Guide* (literature number SPRU430).

### 3.2.8 M0, M1 SARAMs

All C28x devices contain these two blocks of single access memory, each 1K x 16 in size. The stack pointer points to the beginning of block M1 on reset. The M0 block overlaps the 240x device B0, B1, B2 RAM blocks and hence the mapping of data variables on the 240x devices can remain at the same physical address on C28x devices. The M0 and M1 blocks, like all other memory blocks on C28x devices, are mapped to both program and data space. Hence, the user can use M0 and M1 to execute code or for data variables. The partitioning is performed within the linker. The C28x device presents a unified memory map to the programmer. This makes for easier programming in high-level languages.

### 3.2.9 L0, L1, H0 SARAMs

The F281x and C281x contain an additional 16K x 16 of single-access RAM, divided into 3 blocks (4K + 4K + 8K). Each block can be independently accessed hence minimizing pipeline stalls. Each block is mapped to both program and data space.

### 3.2.10 Boot ROM

The Boot ROM is factory-programmed with boot-loading software. Boot-mode signals are provided to tell the bootloader software what boot mode to use on power up. The user can select to boot normally or to download new software from an external connection or to select boot software that is programmed in the internal Flash. The Boot ROM will also contain standard tables, such as SIN/COS waveforms, for use in math related algorithms.

### 3.2.11 Security

The F281x and C281x support high levels of security to protect the user firmware from being reversed engineered. The security features a 128-bit password (hardcoded for 16 wait states), which the user programs into the flash. One code security module (CSM) is used to protect the flash/ROM/OTP and the L0/L1 SARAM blocks. The security feature prevents unauthorized users from examining the memory contents via the JTAG port, executing code from external memory or trying to boot-load some undesirable software that would export the secure memory contents. To enable access to the secure blocks, the user must write the correct 128-bit "KEY" value, which matches the value stored in the password locations within the Flash/ROM.

**NOTE:**

For code security operation, all addresses between 0x3F7F80 and 0x3F7FF5 cannot be used as program code or data, but must be programmed to 0x0000 when the Code Security Passwords are programmed. If security is not a concern, then these addresses may be used for code or data.

The 128-bit password (at 0x3F 7FF8 – 0x3F 7FFF) must *not* be programmed to zeros. Doing so would permanently lock the device.

### Code Security Module Disclaimer

The Code Security Module ("CSM") included on this device was designed to password protect the data stored in the associated memory (either ROM or Flash) and is warranted by Texas Instruments (TI), in accordance with its standard terms and conditions, to conform to TI's published specifications for the warranty period applicable for this device.

TI DOES NOT, HOWEVER, WARRANT OR REPRESENT THAT THE CSM CANNOT BE COMPROMISED OR BREACHED OR THAT THE DATA STORED IN THE ASSOCIATED MEMORY CANNOT BE ACCESSED THROUGH OTHER MEANS. MOREOVER, EXCEPT AS SET FORTH ABOVE, TI MAKES NO WARRANTIES OR REPRESENTATIONS CONCERNING THE CSM OR OPERATION OF THIS DEVICE, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

### 3.2.12 Peripheral Interrupt Expansion (PIE) Block

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the F281x and C281x, 45 of the possible 96 interrupts are used by peripherals. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of the 96 interrupts is, supported by its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is, automatically fetched by the CPU on servicing the interrupt. It takes 8 CPU clock cycles to fetch the vector and save critical CPU registers. Hence the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled/disabled within the PIE block.

### 3.2.13 External Interrupts (XINT1, 2, 13, XNMI)

The F281x and C281x support three masked external interrupts (XINT1, 2, 13). XINT13 is combined with one non-masked external interrupt (XNMI). The combined signal name is XNMI\_XINT13. Each of the interrupts can be selected for negative or positive edge triggering and can also be enabled/disabled (including the XNMI). The masked interrupts also contain a 16-bit free running up counter, which is reset to zero when a valid interrupt edge is detected. This counter can be used to accurately time stamp the interrupt.

### 3.2.14 Oscillator and PLL

The F281x and C281x can be clocked by an external oscillator or by a crystal attached to the on-chip oscillator circuit. A PLL is provided supporting up to 10-input clock-scaling ratios. The PLL ratios can be changed on-the-fly in software, enabling the user to scale back on operating frequency if lower power operation is desired. Refer to the Electrical Specification section for timing details. The PLL block can be set in bypass mode.

### 3.2.15 Watchdog

The F281x and C281x support a watchdog timer. The user software must regularly reset the watchdog counter within a certain time frame; otherwise, the watchdog will generate a reset to the processor. The watchdog can be disabled if necessary.

### 3.2.16 Peripheral Clocking

The clocks to each individual peripheral can be enabled/disabled so as to reduce power consumption when a peripheral is not in use. Additionally, the system clock to the serial ports (except eCAN) and the event managers, CAP and QEP blocks can be scaled relative to the CPU clock. This enables the timing of peripherals to be decoupled from increasing CPU clock speeds.

### 3.2.17 Low-Power Modes

The F281x and C281x devices are full static CMOS devices. Three low-power modes are provided:

- IDLE:** Place CPU into low-power mode. Peripheral clocks may be turned off selectively and only those peripherals that need to function during IDLE are left operating. An enabled interrupt from an active peripheral will wake the processor from IDLE mode.
- STANDBY:** Turn off clock to CPU and peripherals. This mode leaves the oscillator and PLL functional. An external interrupt event will wake the processor and the peripherals. Execution begins on the next valid cycle after detection of the interrupt event.
- HALT:** Turn off oscillator. This mode basically shuts down the device and places it in the lowest possible power consumption mode. Only a reset or XNMI will wake the device from this mode.

### 3.2.18 Peripheral Frames 0, 1, 2 (PFn)

The F281x and C281x segregate peripherals into three sections. The mapping of peripherals is as follows:

<b>PF0:</b>	XINTF: External Interface Configuration Registers (2812 only)
	PIE: PIE Interrupt Enable and Control Registers Plus PIE Vector Table
	Flash: Flash Control, Programming, Erase, Verify Registers
	Timers: CPU-Timers 0, 1, 2 Registers
	CSM: Code Security Module KEY Registers
<b>PF1:</b>	eCAN: eCAN Mailbox and Control Registers

---

<b>PF2:</b>	SYS: System Control Registers
	GPIO: GPIO Mux Configuration and Control Registers
	EV: Event Manager (EVA/EVB) Control Registers
	McBSP: McBSP Control and TX/RX Registers
	SCI: Serial Communications Interface (SCI) Control and RX/TX Registers
	SPI: Serial Peripheral Interface (SPI) Control and RX/TX Registers
	ADC: 12-Bit ADC Registers

### 3.2.19 General-Purpose Input/Output (GPIO) Multiplexer

Most of the peripheral signals are multiplexed with general-purpose I/O (GPIO) signals. This enables the user to use a pin as GPIO if the peripheral signal or function is not used. On reset, all GPIO pins are configured as inputs. The user can then individually program each pin for GPIO mode or Peripheral Signal mode. For specific inputs, the user can also select the number of input qualification cycles. This is to filter unwanted noise glitches.

### 3.2.20 32-Bit CPU-Timers (0, 1, 2)

CPU-Timers 0, 1, and 2 are identical 32-bit timers with presetable periods and with 16-bit clock prescaling. The timers have a 32-bit count down register, which generates an interrupt when the counter reaches zero. The counter is decremented at the CPU clock speed divided by the prescale value setting. When the counter reaches zero, it is automatically reloaded with a 32-bit period value. CPU-Timer 2 is reserved for Real-Time OS (RTOS)/BIOS applications. CPU-Timer 1 is also reserved for TI system functions. CPU-Timer 2 is connected to INT14 of the CPU. CPU-Timer 1 can be connected to INT13 of the CPU. CPU-Timer 0 is for general use and is connected to the PIE block.

### 3.2.21 Control Peripherals

The F281x and C281x support the following peripherals which are used for embedded control and communication:

<b>EV:</b>	The event manager module includes general-purpose timers, full-compare/PWM units, capture inputs (CAP) and quadrature-encoder pulse (QEP) circuits. Two such event managers are provided which enable two three-phase motors to be driven or four two-phase motors. The event managers on the F281x and C281x are compatible to the event managers on the 240x devices (with some minor enhancements).
<b>ADC:</b>	The ADC block is a 12-bit converter, single ended, 16-channels. It contains two sample-and-hold units for simultaneous sampling.

### 3.2.22 Serial Port Peripherals

The F281x and C281x support the following serial communication peripherals:

<b>eCAN:</b>	This is the enhanced version of the CAN peripheral. It supports 32 mailboxes, time stamping of messages, and is CAN 2.0B-compliant.
<b>McBSP:</b>	This is the multichannel buffered serial port that is used to connect to E1/T1 lines, phone-quality codecs for modem applications or high-quality stereo-quality Audio DAC devices. The McBSP receive and transmit registers are supported by a 16-level FIFO. This significantly reduces the overhead for servicing this peripheral.

**SPI:** The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the DSP controller and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multi-device communications are supported by the master/slave operation of the SPI. On the F281x and C281x, the port supports a 16-level, receive and transmit FIFO for reducing servicing overhead.

**SCI:** The serial communications interface is a two-wire asynchronous serial port, commonly known as UART. On the F281x and C281x, the port supports a 16-level, receive and transmit FIFO for reducing servicing overhead.

### 3.3 Register Map

The F281x and C281x devices contain three peripheral register spaces. The spaces are categorized as follows:

- Peripheral Frame 0: These are peripherals that are mapped directly to the CPU memory bus. See Table 3–4.
- Peripheral Frame 1: These are peripherals that are mapped to the 32-bit peripheral bus. See Table 3–5.
- Peripheral Frame 2: These are peripherals that are mapped to the 16-bit peripheral bus. See Table 3–6.

**Table 3–4. Peripheral Frame 0 Registers<sup>†</sup>**

NAME	ADDRESS RANGE	SIZE (x16)	ACCESS TYPE <sup>‡</sup>
Device Emulation Registers	0x00 0880 0x00 09FF	384	EALLOW protected
reserved	0x00 0A00 0x00 0A7F	128	
FLASH Registers <sup>§</sup>	0x00 0A80 0x00 0ADF	96	EALLOW protected CSM Protected
Code Security Module Registers	0x00 0AE0 0x00 0AEF	16	EALLOW protected
reserved	0x00 0AF0 0x00 0B1F	48	
XINTF Registers	0x00 0B20 0x00 0B3F	32	Not EALLOW protected
reserved	0x00 0B40 0x00 0BFF	192	
CPU-TIMER0/1/2 Registers	0x00 0C00 0x00 0C3F	64	Not EALLOW protected
reserved	0x00 0C40 0x00 0CDF	160	
PIE Registers	0x00 0CE0 0x00 0CFF	32	Not EALLOW protected
PIE Vector Table	0x00 0D00 0x00 0DFF	256	EALLOW protected
Reserved	0x00 0E00 0x00 0FFF	512	

<sup>†</sup> Registers in Frame 0 support 16-bit and 32-bit accesses.

<sup>‡</sup> If registers are EALLOW protected, then writes cannot be performed until the user executes the EALLOW instruction. The EDIS instruction disables writes. This prevents stray code or pointers from corrupting register contents.

§ The Flash Registers are also protected by the Code Security Module (CSM).

**Table 3–5. Peripheral Frame 1 Registers¶**

NAME	ADDRESS RANGE	SIZE (x16)	ACCESS TYPE
eCAN Registers	0x00 6000 0x00 60FF	256 (128 x 32)	Some eCAN control registers (and selected bits in other eCAN control registers) are EALLOW-protected.
eCAN Mailbox RAM	0x00 6100 0x00 61FF	256 (128 x 32)	Not EALLOW-protected
reserved	0x00 6200 0x00 6FFF	3584	

¶ The eCAN control registers only support 32-bit read/write operations. All 32-bit accesses are aligned to even address boundaries.

**Table 3–6. Peripheral Frame 2 Registers<sup>†</sup>**

NAME	ADDRESS RANGE	SIZE (x16)	ACCESS TYPE
reserved	0x00 7000 0x00 700F	16	
System Control Registers	0x00 7010 0x00 702F	32	EALLOW Protected
reserved	0x00 7030 0x00 703F	16

McBSP Registers	0x00 7800 0x00 783F	64	Not EALLOW Protected
reserved	0x00 7840 0x00 7FFF	1984	

<sup>†</sup> Peripheral Frame 2 only allows 16-bit accesses. All 32-bit accesses are ignored (invalid data may be returned or written).

### 3.4 Device Emulation Registers

These registers are used to control the protection mode of the C28x CPU and to monitor some critical device signals. The registers are defined in Table 3–7.

**Table 3–7. Device Emulation Registers**

NAME	ADDRESS RANGE	SIZE (x16)	DESCRIPTION
DEVICECNF	0x00 0880 0x00 0881	2	Device Configuration Register
reserved	0x00 0882	1	Not supported on Revision C and later silicon
DEVICEID	0x00 0883	1	Device ID Register (0x0003 – Silicon – Rev. C and D) Device ID Register (0x0004 – Reserved) Device ID Register (0x0005 – Silicon – Rev. E)
PROTSTART	0x00 0884	1	Block Protection Start Address Register
PROTRANGE	0x00 0885	1	Block Protection Range Address Register
reserved	0x00 0886 0x00 09FF	378	

### 3.5 External Interface, XINTF (2812 Only)

This section gives a top-level view of the external interface (XINTF) that is implemented on the 2812 devices.

The external interface is a non-multiplexed asynchronous bus, similar to the C240x external interface. The external interface on the 2812 is mapped into five fixed zones shown in Figure 3–5.

Figure 3–5 shows the 2812 XINTF signals.

NOTES:

- The mapping of XINTF Zone 7 is dependent on the XMP/MC device input signal and the MP/MC mode bit (bit 8 of XINTCNF2 register). Zones 0, 1, 2, and 6 are always enabled.
- Each zone can be programmed with different wait states, setup and hold timing, and is supported by zone chip selects (XZCS0AND1, XZCS2, XZCS6AND7), which toggle when an access to a particular zone is performed. These features enable glueless connection to many external memories and peripherals.
- The chip selects for Zone 0 and 1 are ANDed internally together to form one chip select (XZCS0AND1). Any external memory that is connected to XZCS0AND1 is dually mapped to both Zones 0 and Zone 1.
- The chip selects for Zone 6 and 7 are ANDed internally together to form one chip select (XZCS6AND7). Any external memory that is connected to XZCS6AND7 is dually mapped to both Zones 6 and Zone 7. This means that if Zone 7 is disabled (via the MP/MC mode) then any external memory is still accessible via Zone 6 address space.
- XCLKOUT is also pinned out on the 2810 and 2811.

**Figure 3–5. External Interface Block Diagram**

The operation and timing of the external interface, can be controlled by the registers listed in Table 3–8.

**Table 3–8. XINTF Configuration and Control Register Mappings**

NAME	ADDRESS	SIZE (x16)	DESCRIPTION
XTIMING0	0x00 0B20	2	XINTF Timing Register, Zone 0 can access as two 16-bit registers or one 32-bit register
XTIMING1	0x00 0B22	2	XINTF Timing Register, Zone 1 can access as two 16-bit registers or one 32-bit register
XTIMING2	0x00 0B24	2	XINTF Timing Register, Zone 2 can access as two 16-bit registers or one 32-bit register
XTIMING6	0x00 0B2C	2	XINTF Timing Register, Zone 6 can access as two 16-bit registers or one 32-bit register
XTIMING7	0x00 0B2E	2	XINTF Timing Register, Zone 7 can access as two 16-bit registers or one 32-bit register
XINTCNF2	0x00 0B34	2	XINTF Configuration Register can access as two 16-bit registers or one 32-bit register
XBANK	0x00 0B38	1	XINTF Bank Control Register
XREVISION	0x00 0B3A	1	XINTF Revision Register

### 3.5.1 Timing Registers

XINTF signal timing can be tuned to match specific external device requirements such as setup and hold times to strobe signals for contention avoidance and maximizing bus efficiency. The timing parameters can be configured individually for each zone. This allows the programmer to maximize the efficiency of the bus, based on the type of memory or peripheral that the user needs to access. All XINTF timing values are with respect to XTIMCLK, which is equal to or one-half of the SYSCLKOUT rate, as shown in Figure 6–28.

For detailed information on the XINTF timing and configuration register bit fields, see the *TMS320F28x DSP External Interface (XINTF) Reference Guide* (literature number SPRU067).

### 3.5.2 XREVISION Register

The XREVISION register contains a unique number to identify the particular version of XINTF used in the product. For the 2812, this register will be configured as described in Table 3–9.

**Table 3–9. XREVISION Register Bit Definitions**

BIT(S)	NAME	TYPE	RESET	DESCRIPTION
15–0	REVISION	R	0x0004	Current XINTF Revision. For internal use/reference. Test purposes only. Subject to change.

### 3.6 Interrupts

Figure 3–6 shows how the various interrupt sources are multiplexed within the F281x and C281x devices.

† Out of a possible 96 interrupts, 45 are currently used by peripherals.

**Figure 3–6. Interrupt Sources**

Eight PIE block interrupts are grouped into one CPU interrupt. In total, 12 CPU interrupt groups, with 8 interrupts per group equals 96 possible interrupts. On the F281x and C281x, 45 of these are used by peripherals as shown in Table 3-10.

Figure 3-7. Multiplexing of Interrupts Using the PIE Block

Table 3-10. PIE Peripheral Interrupts<sup>†</sup>

CPU INTERRUPTS	PIE INTERRUPTS

reserved	0x00 707A 0x00 707E	5	
XNMICTR	0x00 707F	1	XNMI counter register

Each external interrupt can be enabled/disabled or qualified using positive or negative going edge. For more information, see the *TMS320F28x System Control and Interrupts Reference Guide* (literature number SPRU078).

### 3.7 System Control

This section describes the F281x and C281x oscillator, PLL and clocking mechanisms, the watchdog function and the low power modes. Figure 3-8 shows the various clock and reset domains in the F281x and C281x devices that will be discussed.

NOTE A: CLKIN is the clock input to the CPU. SYCLKOUT is the output clock of the CPU. They are of the same frequency.

Figure 3-8. Clock and Reset Domains

The PLL, clocking, watchdog and low-power modes, are controlled by the registers listed in Table 3–13.

**Table 3–13. PLL, Clocking, Watchdog, and Low-Power Mode Registers†**

NAME	ADDRESS	SIZE (x16)	DESCRIPTION
reserved	0x00 7010 0x00 7017	8	
reserved	0x00 7018	1	
reserved	0x00 7019	1

reserved	0x00 702A 0x00 702F	6	

† All of the above registers can only be accessed, by executing the EALLOW instruction.

‡ The PLL control register (PLLCR) is reset to a known state by the XRS signal only. Emulation reset (through Code Composer Studio) will not reset PLLCR.

### 3.8 OSC and PLL Block

Figure 3–9 shows the OSC and PLL block on the F281x and C281x.

**Figure 3–9. OSC and PLL Block**

The on-chip oscillator circuit enables a crystal to be attached to the F281x and C281x devices using the X1/XCLKIN and X2 pins. If a crystal is not used, then an external oscillator can be directly connected to the X1/XCLKIN pin and the X2 pin is left unconnected. The logic-high level in this case should not exceed  $V_{DD}$ . The PLLCR bits [3:0] set the clocking ratio.

**Table 3–14. PLLCR Register Bit Definitions**

BIT(S)	NAME	TYPE	XRS RESET†	DESCRIPTION		
15:4	reserved	R = 0	0:0

<sup>†</sup>The PLLCR register is reset to a known state by the XRS reset line. If a reset is issued by the debugger, the PLL clocking ratio is not changed.

### 3.8.1 Loss of Input Clock

In PLL enabled mode, if the input clock XCLKIN or the oscillator clock is removed or absent, the PLL will still issue a “limp-mode” clock. The limp-mode clock will continue to clock the CPU and peripherals at a typical frequency of 1–4 MHz. The PLLCR register should have been written to with a non-zero value for this feature to work.

Normally, when the input clocks are present, the watchdog counter will decrement to initiate a watchdog reset or WDINT interrupt. However, when the external input clock fails, the watchdog counter will stop decrementing (i.e., the watchdog counter does not change with the limp-mode clock). This condition could be used by the application firmware to detect the input clock failure and initiate necessary shut-down procedure for the system.

## 3.9 PLL-Based Clock Module

The F281x and C281x have an on-chip, PLL-based clock module. This module provides all the necessary clocking signals for the device, as well as control for low-power mode entry. The PLL has a 4-bit ratio control to select different CPU clock rates. The watchdog module should be disabled before writing to the PLLCR register. It can be re-enabled (if need be) after the PLL module has stabilized, which takes 131 072 XCLKIN cycles.

The PLL-based clock module provides two modes of operation:

- Crystal-operation  
This mode allows the use of an external crystal/resonator to provide the time base to the device.
- External clock source operation  
This mode allows the internal oscillator to be bypassed. The device clocks are generated from an external clock source input on the X1/XCLKIN pin.

NOTE A: TI recommends that customers have the resonator/crystal vendor characterize the operation of their device with the DSP chip. The resonator/crystal vendor has the equipment and expertise to tune the tank circuit. The vendor can also advise the customer regarding the proper tank component values that will ensure start-up and stability over the entire operating range.

Figure 3-10. Recommended Crystal/Clock Connection

Table 3-15. Possible PLL Configuration Modes

PLL MODE	REMARKS	SYSCLKOUT
PLL Disabled	Invoked by tying <u>XPLLDIS</u> pin low upon reset. PLL block is completely disabled. Clock input to the CPU (CLKIN) is directly derived from the clock signal present at the X1/XCLKIN pin.	XCLKIN
PLL Bypassed	Default PLL configuration upon power-up, if PLL is not disabled. The PLL itself is bypassed. However, the /2 module in the PLL block divides the clock input at the X1/XCLKIN pin by two before feeding it to the CPU.	XCLKIN/2
PLL Enabled	Achieved by writing a non-zero value “n” into PLLCR register. The /2 module in the PLL block now divides the output of the PLL by two before feeding it to the CPU.	(XCLKIN * n) / 2

### 3.10 External Reference Oscillator Clock Option

The typical specifications for the external quartz crystal for a frequency of 30 MHz are listed below:

- Fundamental mode, parallel resonant
- $C_L$  (load capacitance) = 12 pF
- $C_{L1} = C_{L2} = 24$  pF
- $C_{\text{shunt}} = 6$  pF
- ESR range = 25 to 40  $\Omega$

### 3.11 Watchdog Block

The watchdog block on the F281x and C281x is identical to the one used on the 240x devices. The watchdog module generates an output pulse, 512 oscillator clocks wide (OSCCLK), whenever the 8-bit watchdog up counter has reached its maximum value. To prevent this, the user disables the counter or the software must periodically write a 0x55 + 0xAA sequence into the watchdog key register which will reset the watchdog counter. Figure 3-11 shows the various functional blocks within the watchdog module.

NOTE A: The **WDRST** signal is driven low for 512 OSCCLK cycles.

Figure 3-11. Watchdog Module

The **WDINT** signal enables the watchdog to be used as a wakeup from IDLE/STANDBY mode timer.

In STANDBY mode, all peripherals are turned off on the device. The only peripheral that remains functional is the watchdog. The WATCHDOG module will run off the PLL clock or the oscillator clock. The **WDINT** signal is fed to the LPM block so that it can wake the device from STANDBY (if enabled). See Section 3.12, Low-Power Modes Block, for more details.

In IDLE mode, the  $\overline{\text{WDINT}}$  signal can generate an interrupt to the CPU, via the PIE, to take the CPU out of IDLE mode.

In HALT mode, this feature cannot be used because the oscillator (and PLL) are turned off and hence so is the WATCHDOG.

### 3.12 Low-Power Modes Block

The low-power modes on the F281x and C281x are similar to the 240x devices. Table 3–16 summarizes the various modes.

**Table 3–16. F281x and C281x Low-Power Modes**

MODE	LPM(1:0)	OSCCLK	CLKIN	SYSCLKOUT	EXIT <sup>†</sup>
Normal	X,X	on	on	on	—
IDLE	0,0	on	on	on <sup>‡</sup>	$\overline{\text{XRS}}$ , $\overline{\text{WDINT}}$ , Any Enabled Interrupt, XNMI, Debugger <sup>§</sup>
STANDBY	0,1	on (watchdog still running)	off	off	$\overline{\text{XRS}}$ , $\overline{\text{WDINT}}$ , $\overline{\text{XINT1}}$ , $\overline{\text{XNMI}}$ , $\overline{\text{T1/2/3/4CTRIP}}$ , $\overline{\text{C1/2/3/4/5/6TRIP}}$ , SCIRXDA, SCIRXDB, CANRX, Debugger <sup>§</sup>
HALT	1,X	off (oscillator and PLL turned off, watchdog not functional)	off	off	$\overline{\text{XRS}}$ , XNMI, Debugger <sup>§</sup>

<sup>†</sup> The Exit column lists which signals or under what conditions the low power mode will be exited. A low signal, on any of the signals, will exit the low power condition. This signal must be kept low long enough for an interrupt to be recognized by the device. Otherwise the IDLE mode will not be exited and the device will go back into the indicated low power mode.

<sup>‡</sup> The IDLE mode on the C28x behaves differently than on the 24x/240x. On the C28x, the clock output from the core (SYSCLKOUT) is still functional while on the 24x/240x the clock is turned off.

<sup>§</sup> On the C28x, the JTAG port can still function even if the core clock (CLKIN) is turned off.

The various low-power modes operate as follows:

#### IDLE Mode:

This mode is exited by any enabled interrupt or an XNMI that is recognized by the processor. The LPM block performs no tasks during this mode as long as the LPMCR0(LPM) bits are set to 0,0.

#### STANDBY Mode:

All other signals (including XNMI) will wake the device from STANDBY mode if selected by the LPMCR1 register. The user will need to select which signal(s) will wake the device. The selected signal(s) are also qualified by the OSCCLK before waking the device. The number of OSCCLKs is specified in the LPMCR0 register.

#### HALT Mode:

Only the  $\overline{\text{XRS}}$  and XNMI external signals can wake the device from HALT mode. The XNMI input to the core has an enable/disable bit. Hence, it is safe to use the XNMI signal for this function.

**NOTE:** The low-power modes do not affect the state of the output pins (PWM pins included). They will be in whatever state the code left them in when the IDLE instruction was executed.

## 4 Peripherals

The integrated peripherals of the F281x and C281x are described in the following subsections:

- Three 32-bit CPU-Timers
- Two event-manager modules (EVA, EVB)
- Enhanced analog-to-digital converter (ADC) module
- Enhanced controller area network (eCAN) module
- Multichannel buffered serial port ( McBSP) module
- Serial communications interface modules (SCI-A, SCI-B)
- Serial peripheral interface (SPI) module
- Digital I/O and shared pin functions

### 4.1 32-Bit CPU-Timers 0/1/2

There are three 32-bit CPU-timers on the F281x and C281x devices (CPU-TIMER0/1/2).

CPU-Timers 1 and 2 are reserved for the real-time OS (such as DSP/BIOS). CPU-Timer 0 can be used in user applications. These timers are different from the general-purpose (GP) timers that are present in the Event Manager modules (EVA, EVB).

**NOTE:** If the application is not using DSP/BIOS, then CPU-Timers 1 and 2 can be used in the application.

Figure 4–1. CPU-Timers

In the F281x and C281x devices, the timer interrupt signals ( $\overline{\text{TINT0}}$ ,  $\overline{\text{TINT1}}$ ,  $\overline{\text{TINT2}}$ ) are connected as shown in Figure 4-2.

NOTES: A. The timer registers are connected to the Memory Bus of the C28x processor.  
 B. The timing of the timers is synchronized to SYSCLKOUT of the processor clock.

**Figure 4-2. CPU-Timer Interrupts Signals and Output Signal (See Notes A and B)**

The general operation of the timer is as follows: The 32-bit counter register “TIMH:TIM” is loaded with the value in the period register “PRDH:PRD”. The counter register, decrements at the SYSCLKOUT rate of the C28x. When the counter reaches 0, a timer interrupt output signal generates an interrupt pulse. The registers listed in Table 4-1 are used to configure the timers. For more information, see the *TMS320F28x System Control and Interrupts Reference Guide* (literature number SPRU078).

**Table 4-1. CPU-Timers 0, 1, 2 Configuration and Control Registers**

## 4.2 Event Manager Modules (EVA, EVB)

The event-manager modules include general-purpose (GP) timers, full-compare/PWM units, capture units, and quadrature-encoder pulse (QEP) circuits. EVA and EVB timers, compare units, and capture units function identically. However, timer/unit names differ for EVA and EVB. Table 4–2 shows the module and signal names used. Table 4–2 shows the features and functionality available for the event-manager modules and highlights EVA nomenclature.

Event managers A and B have identical peripheral register sets with EVA starting at 7400h and EVB starting at 7500h. The paragraphs in this section describe the function of GP timers, compare units, capture units, and QEPs using EVA nomenclature. These paragraphs are applicable to EVB with regard to function—however, module/signal names would differ. Table 4–3 lists the EVA registers. For more information, see the *TMS320F28x DSP Event Manager (EV) Reference Guide* (literature number SPRU065).

**Table 4–2. Module and Signal Names for EVA and EVB**

EVENT MANAGER MODULES	EVA		EVB

EVAIFRC	0x00 7431	1	Interrupt Flag Register C

† The EV-B register set is identical except the address range is from 0x00–7500 to 0x00–753F. The above registers are mapped to Zone 2. This space allows only 16-bit accesses. 32-bit accesses produce undefined results.

‡ New register compared to 24x/240x

NOTE A: The EVB module is similar to the EVA module.

Figure 4-3. Event Manager A Functional Block Diagram (See Note A)

#### 4.2.1 General-Purpose (GP) Timers

There are two GP timers. The GP timer  $x$  ( $x = 1$  or  $2$  for EVA;  $x = 3$  or  $4$  for EVB) includes:

- A 16-bit timer, up-/down-counter, TxCNT, for reads or writes
- A 16-bit timer-compare register, TxCMPR (double-buffered with shadow register), for reads or writes
- A 16-bit timer-period register, TxPR (double-buffered with shadow register), for reads or writes
- A 16-bit timer-control register, TxCON, for reads or writes
- Selectable internal or external input clocks
- A programmable prescaler for internal or external clock inputs
- Control and interrupt logic, for four maskable interrupts: *underflow*, *overflow*, *timer compare*, and *period interrupts*
- A selectable direction input pin (TDIRx) (to count up or down when directional up-/down-count mode is selected)

The GP timers can be operated independently or synchronized with each other. The compare register associated with each GP timer can be used for compare function and PWM-waveform generation. There are three continuous modes of operations for each GP timer in up- or up/down-counting operations. Internal or external input clocks with programmable prescaler are used for each GP timer. GP timers also provide the time base for the other event-manager submodules: GP timer 1 for all the compares and PWM circuits, GP timer 2/1 for the capture units and the quadrature-pulse counting operations. Double-buffering of the period and compare registers allows programmable change of the timer (PWM) period and the compare/PWM pulse width as needed.

#### 4.2.2 Full-Compare Units

There are three full-compare units on each event manager. These compare units use GP timer1 as the time base and generate six outputs for compare and PWM-waveform generation using programmable deadband circuit. The state of each of the six outputs is configured independently. The compare registers of the compare units are double-buffered, allowing programmable change of the compare/PWM pulse widths as needed.

#### 4.2.3 Programmable Deadband Generator

Deadband generation can be enabled/disabled for each compare unit output individually. The deadband-generator circuit produces two outputs (with or without deadband zone) for each compare unit output signal. The output states of the deadband generator are configurable and changeable as needed by way of the double-buffered ACTRx register.

#### 4.2.4 PWM Waveform Generation

Up to eight PWM waveforms (outputs) can be generated simultaneously by each event manager: three independent pairs (six outputs) by the three full-compare units with *programmable deadbands*, and two independent PWMs by the GP-timer compares.

#### 4.2.5 Double Update PWM Mode

The F281x and C281x Event Manager supports “Double Update PWM Mode.” This mode refers to a PWM operation mode in which the position of the leading edge and the position of the trailing edge of a PWM pulse are independently modifiable in each PWM period. To support this mode, the compare register that determines the position of the edges of a PWM pulse must allow (buffered) compare value update once at the beginning of a PWM period and another time in the middle of a PWM period. The compare registers in F281x and C281x Event Managers are all buffered and support three compare value reload/update (value in buffer becoming active) modes. These modes have earlier been documented as compare value reload conditions. The reload condition that supports double update PWM mode is reloaded on Underflow (beginning of PWM period) OR Period (middle of PWM period). Double update PWM mode can be achieved by using this condition for compare value reload.

#### 4.2.6 PWM Characteristics

Characteristics of the PWMs are as follows:

- 16-bit registers
- Wide range of programmable deadband for the PWM output pairs
- Change of the PWM carrier frequency for PWM frequency wobbling as needed
- Change of the PWM pulse widths within and after each PWM period as needed
- External-maskable power and drive-protection interrupts
- Pulse-pattern-generator circuit, for programmable generation of asymmetric, symmetric, and four-space vector PWM waveforms
- Minimized CPU overhead using auto-reload of the compare and period registers
- The PWM pins are driven to a high-impedance state when the PDPINTx pin is driven low and **after** PDPINTx signal qualification. The PDPINTx pin (after qualification) is reflected in bit 8 of the COMCONx register.
  - PDPINTA pin status is reflected in bit 8 of COMCONA register.
  - PDPINTB pin status is reflected in bit 8 of COMCONB register.
- EXTCON register bits provide options to individually trip control for each PWM pair of signals

#### 4.2.7 Capture Unit

The capture unit provides a logging function for different events or transitions. The values of the selected GP timer counter is captured and stored in the two-level-deep FIFO stacks when selected transitions are detected on capture input pins, CAPx (x = 1, 2, or 3 for EVA; and x = 4, 5, or 6 for EVB). The capture unit consists of three capture circuits.

- Capture units include the following features:
  - One 16-bit capture control register, CAPCONx (R/W)
  - One 16-bit capture FIFO status register, CAPFIFOx
  - Selection of GP timer 1/2 (for EVA) or 3/4 (for EVB) as the time base
  - Three 16-bit 2-level-deep FIFO stacks, one for each capture unit
  - Three capture input pins (CAP1/2/3 for EVA, CAP4/5/6 for EVB)—one input pin per capture unit. [All inputs are synchronized with the device (CPU) clock. In order for a transition to be captured, the input must hold at its current level to meet the input qualification circuitry requirements. The input pins CAP1/2 and CAP4/5 can also be used as QEP inputs to the QEP circuit.]
  - User-specified transition (rising edge, falling edge, or both edges) detection
  - Three maskable interrupt flags, one for each capture unit
  - The capture pins can also be used as general-purpose interrupt pins, if they are not used for the capture function.

#### 4.2.8 Quadrature-Encoder Pulse (QEP) Circuit

Two capture inputs (CAP1 and CAP2 for EVA; CAP4 and CAP5 for EVB) can be used to interface the on-chip QEP circuit with a quadrature encoder pulse. Full synchronization of these inputs is performed on-chip. Direction or leading-quadrature pulse sequence is detected, and GP timer 2/4 is incremented or decremented by the rising and falling edges of the two input signals (four times the frequency of either input pulse).

With EXTCONA register bits, the EVA QEP circuit can use CAP3 as a capture index pin as well. Similarly, with EXTCONB register bits, the EVB QEP circuit can use CAP6 as a capture index pin.

#### 4.2.9 External ADC Start-of-Conversion

EVA/EVB start-of-conversion (SOC) can be sent to an external pin ( $\overline{\text{EVASOC}}/\overline{\text{EVBSOC}}$ ) for external ADC interface.  $\overline{\text{EVASOC}}$  and  $\overline{\text{EVBSOC}}$  are MUXed with  $\overline{\text{T2CTRIP}}$  and  $\overline{\text{T4CTRIP}}$ , respectively.

### 4.3 Enhanced Analog-to-Digital Converter (ADC) Module

A simplified functional block diagram of the ADC module is shown in Figure 4–4. The ADC module consists of a 12-bit ADC with a built-in sample-and-hold (S/H) circuit. Functions of the ADC module include:

- 12-bit ADC core with built-in S/H
- Analog input: 0.0 V to 3.0 V (Voltages above 3.0 V produce full-scale conversion results.)
- Fast conversion rate: 80 ns at 25-MHz ADC clock, 12.5 MSPS
- 16-channel, MUXed inputs
- Autosequencing capability provides up to 16 “autoconversions” in a single session. Each conversion can be programmed to select any 1 of 16 input channels
- Sequencer can be operated as two independent 8-state sequencers or as one large 16-state sequencer (i.e., two cascaded 8-state sequencers)
- Sixteen result registers (individually addressable) to store conversion values
  - The digital value of the input analog voltage is derived by:

$$\text{Digital Value} = 4095 \times \frac{\text{Input Analog Voltage} - \text{ADCLO}}{3}$$

- Multiple triggers as sources for the start-of-conversion (SOC) sequence
  - S/W – software immediate start
  - EVA – Event manager A (multiple event sources within EVA)
  - EVB – Event manager B (multiple event sources within EVB)
- Flexible interrupt control allows interrupt request on every end-of-sequence (EOS) or every other EOS
- Sequencer can operate in “start/stop” mode, allowing multiple “time-sequenced triggers” to synchronize conversions
- EVA and EVB triggers can operate independently in dual-sequencer mode
- Sample-and-hold (S/H) acquisition time window has separate prescale control

The ADC module in the F281x and C281x has been enhanced to provide flexible interface to event managers A and B. The ADC interface is built around a fast, 12-bit ADC module with a fast conversion rate of 80 ns at 25-MHz ADC clock. The ADC module has 16 channels, configurable as two independent 8-channel modules to service event managers A and B. The two independent 8-channel modules can be cascaded to form a 16-channel module. Although there are multiple input channels and two sequencers, there is only one converter in the ADC module. Figure 4–4 shows the block diagram of the F281x and C281x ADC module.

The two 8-channel modules have the capability to autosequence a series of conversions, each module has the choice of selecting any one of the respective eight channels available through an analog MUX. In the cascaded mode, the autosequencer functions as a single 16-channel sequencer. On each sequencer, once the conversion is complete, the selected channel value is stored in its respective RESULT register. Autosequencing allows the system to convert the same channel multiple times, allowing the user to perform oversampling algorithms. This gives increased resolution over traditional single-sampled conversion results.

Figure 4-4. Block Diagram of the F281x and C281x ADC Module

To obtain the specified accuracy of the ADC, proper board layout is very critical. To the best extent possible, traces leading to the ADCIN pins should not run in close proximity to the digital signal paths. This is to minimize switching noise on the digital lines from getting coupled to the ADC inputs. Furthermore, proper isolation techniques must be used to isolate the ADC module power pins ( $V_{DDA1}/V_{DDA2}$ ,  $AV_{DDREFBG}$ ) from the digital supply. Figure 4-5 shows the ADC pin connections for the F281x and C281x devices.

#### Notes:

1. The ADC registers are accessed at the **SYSCLKOUT** rate. The internal timing of the ADC module is controlled by the high-speed peripheral clock (**HSPCLK**).
2. The behavior of the ADC module based on the state of the **ADCENCLK** and **HALT** signals is as follows:

**ADCENCLK:** On reset, this signal will be low. While reset is active-low ( $\overline{XRS}$ ) the clock to the register will still function. This is necessary to make sure all registers and modes go into their default reset state. The analog module will however be in a low-power inactive state. As soon as reset goes high, then the clock to the registers will be disabled. When the user sets the **ADCENCLK** signal high, then the clocks to the registers will be enabled and the analog module will be enabled. There will be a certain time delay (ms range) before the ADC is stable and can be used.

**HALT:** This signal only affects the analog module. It does not affect the registers. If low, the ADC module is powered. If high, the ADC module goes into low-power mode. The **HALT** mode will stop the clock to the CPU, which will stop the **HSPCLK**. Therefore the ADC register logic will be turned off indirectly.

Figure 4–5 shows the ADC pin-biasing for internal reference and Figure 4–6 shows the ADC pin-biasing for external reference.

† Provide access to this pin in PCB layouts. Intended for test purposes only.

‡ TAIYO YUDEN EMK325F106ZH, EMK325BJ106MD, or equivalent

NOTES: A. External decoupling capacitors are recommended on all power pins.

B. Analog inputs must be driven from an operational amplifier that does not degrade the ADC performance.

C. Use 24.9 kΩ for ADC clock range 1 – 18.75 MHz; use 20 kΩ for ADC clock range 18.75 – 25 MHz.

**Figure 4–5. ADC Pin Connections With Internal Reference (See Notes A and B)**

**NOTE:**

The temperature rating of any recommended component must match the rating of the end product.

NOTES:

- External decoupling capacitors are recommended on all power pins.
- Analog inputs must be driven from an operational amplifier that does not degrade the ADC performance.
- Use 24.9 kΩ for ADC clock range 1 – 18.75 MHz; use 20 kΩ for ADC clock range 18.75 – 25 MHz.
- It is recommended that buffered external references be provided with a voltage difference of (ADCREFP–ADCREFM) = 1 V  $\pm$  0.1% or better.

External reference is enabled using bit 8 in the ADCTRL3 Register at ADC power up. In this mode, the accuracy of external reference is critical for overall gain. The voltage ADCREFP–ADCREFM will determine the overall accuracy. Do not enable internal references when external references are connected to ADCREFP and ADCREFM. See the *TMS320F28x DSP Analog-to-Digital Converter (ADC) Reference Guide* (literature number SPRU060) for more information.

Figure 4-6. ADC Pin Connections With External Reference

The ADC operation is configured, controlled, and monitored by the registers listed in Table 4–4.

## 4.4 Enhanced Controller Area Network (eCAN) Module

The CAN module has the following features:

- Fully compliant with CAN protocol, version 2.0B
- Supports data rates up to 1 Mbps
- Thirty-two mailboxes, each with the following properties:
  - Configurable as receive or transmit
  - Configurable with standard or extended identifier
  - Has a programmable receive mask
  - Supports data and remote frame
  - Composed of 0 to 8 bytes of data
  - Uses a 32-bit time stamp on receive and transmit message
  - Protects against reception of new message
  - Holds the dynamically programmable priority of transmit message
  - Employs a programmable interrupt scheme with two interrupt levels
  - Employs a programmable alarm on transmission or reception time-out
- Low-power mode
- Programmable wake-up on bus activity
- Automatic reply to a remote request message
- Automatic retransmission of a frame in case of loss of arbitration or error
- 32-bit local network time counter synchronized by a specific message (communication in conjunction with mailbox 16)
- Self-test mode
  - Operates in a loopback mode receiving its own message. A “dummy” acknowledge is provided, thereby eliminating the need for another node to provide the acknowledge bit.

**NOTE:** For a SYSCLKOUT of 150 MHz, the smallest bit rate possible is 23.4 kbps.

The 28x CAN has passed the conformance test per ISO/DIS 16845. Contact TI for further details.

† These registers are mapped to Peripheral Frame 1.

## 4.5 Multichannel Buffered Serial Port (McBSP) Module

The McBSP module has the following features:

- Compatible to McBSP in TMS320C54x™ /TMS320C55x™ DSP devices, except the DMA features
- Full-duplex communication
- Double-buffered data registers which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- External shift clock generation or an internal programmable frequency shift clock
- A wide selection of data sizes including 8-, 12-, 16-, 20-, 24-, or 32-bits
- 8-bit data transfers with LSB or MSB first
- Programmable polarity for both frame synchronization and data clocks
- Highly programmable internal clock and frame generation
- Support A-bis mode
- Direct interface to industry-standard CODECs, Analog Interface Chips (AICs), and other serially connected A/D and D/A devices
- Works with SPI-compatible devices
- Two 16 x 16-level FIFO for Transmit channel
- Two 16 x 16-level FIFO for Receive channel

The following application interfaces can be supported on the McBSP:

- T1/E1 framers
- MVIP switching-compatible and ST-BUS-compliant devices including:
  - MVIP framers
  - H.100 framers
  - SCSA framers
  - IOM-2 compliant devices
  - AC97-compliant devices (the necessary multiphase frame synchronization capability is provided.)
  - IIS-compliant devices
- McBSP clock rate =  $CLKG = \frac{CLKSRG}{(1 + CLKGDIV)}$ , where CLKSRG source could be LSPCLK, CLKX, or CLKR.<sup>†</sup>

TMS320C54x and TMS320C55x are trademarks of Texas Instruments.

<sup>†</sup> Serial port performance is limited by I/O buffer switching speed. Internal prescalers must be adjusted such that the peripheral speed is less than the I/O buffer speed limit—20-MHz maximum.

Figure 4–9 shows the block diagram of the McBSP module with FIFO, interfaced to the F281x and C281x version of Peripheral Frame 2.

Figure 4–9. McBSP Module With FIFO

Table 4–7 provides a summary of the McBSP registers.

**Table 4–7. McBSP Register Summary**

<sup>†</sup> DRR2/DRR1 and DXR2/DXR1 share the same addresses of receive and transmit FIFO registers in FIFO mode.

<sup>‡</sup> FIFO pointers advancing is based on order of access to DRR2/DRR1 and DXR2/DXR1 registers.

## 4.6 Serial Communications Interface (SCI) Module

The F281x and C281x devices include two serial communications interface (SCI) modules. The SCI modules support digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format. The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full-duplex mode. To ensure data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to over 65000 different speeds through a 16-bit baud-select register.

Features of each SCI module include:

- Two external pins:
  - SCITXD: SCI transmit-output pin
  - SCIRXD: SCI receive-input pin

NOTE: Both pins can be used as GPIO if not used for SCI.
- Baud rate programmable to 64K different rates<sup>†</sup>
  - Baud rate =  $\frac{\text{LSPCLK}}{(\text{BRR} + 1) * 8}$ , when  $\text{BRR} \neq 0$
  - $= \frac{\text{LSPCLK}}{16}$ , when  $\text{BRR} = 0$
- Data-word format
  - One start bit
  - Data-word length programmable from one to eight bits
  - Optional even/odd/no parity bit
  - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
  - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
  - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)
- Max bit rate =  $\frac{150 \text{ MHz}}{2 \times 8} = 9.375 \times 10^6 \text{ b/s}$

<sup>†</sup> Serial port performance is limited by I/O buffer switching speed. Internal prescalers must be adjusted such that the peripheral speed is less than the I/O buffer speed limit—20 MHz maximum.

- NRZ (non-return-to-zero) format
- Ten SCI module control registers located in the control register frame beginning at address 7050h

NOTE: All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced features:

- Auto baud-detect hardware logic
- 16-level transmit/receive FIFO

The SCI port operation is configured and controlled by the registers listed in Table 4–8 and Table 4–9.

**Table 4–8. SCI-A Registers<sup>†</sup>**

NAME	ADDRESS	SIZE (x16)	DESCRIPTION

SCIFFCTB	0x00 775C	1	SCI-B FIFO Control Register
SCIPRIB	0x00 775F	1	SCI-B Priority Control Register

<sup>†</sup> Shaded registers are new registers for the FIFO mode.

<sup>††</sup> Registers in this table are mapped to peripheral bus 16 space. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

Figure 4–10 shows the SCI module block diagram.

Figure 4–10. Serial Communications Interface (SCI) Module Block Diagram

## 4.7 Serial Peripheral Interface (SPI) Module

The F281x and C281x devices include the four-pin serial peripheral interface (SPI) module. The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the DSP controller and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI.

The SPI module features include:

- Four external pins:
  - SPISOMI: SPI slave-output/master-input pin
  - SPISIMO: SPI slave-input/master-output pin
  - SPISTE: SPI slave transmit-enable pin
  - SPICLK: SPI serial-clock pin

NOTE: All four pins can be used as GPIO, if the SPI module is not used.

- Two operational modes: master and slave
- Baud rate: 125 different programmable rates
  - Baud rate =  $\frac{\text{LSPCLK}}{(\text{SPIBRR} + 1)}$ , when  $\text{BRR} \neq 0$   
 $= \frac{\text{LSPCLK}}{4}$ , when  $\text{BRR} = 0, 1, 2, 3$

Serial port performance is limited by I/O buffer switching speed. Internal prescalers must be adjusted such that the peripheral speed is less than the I/O buffer speed limit—20 MHz maximum.
- Data word length: one to sixteen data bits
- Four clocking schemes (controlled by clock polarity and clock phase bits) include:
  - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
  - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
  - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
  - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
- Nine SPI module control registers: Located in control register frame beginning at address 7040h.

NOTE: All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Enhanced feature:

- 16-level transmit/receive FIFO
- Delayed transmit control

The SPI port operation is configured and controlled by the registers listed in Table 4–10.

**Table 4–10. SPI Registers**

NAME	ADDRESS	SIZE (x16)	DESCRIPTION
SPICCR	0x00 7040	1	SPI Configuration Control Register
SPICTL	0x00 7041	1	SPI Operation Control Register
SPISTS	0x00 7042	1	SPI Status Register
SPIBRR	0x00 7044	1	SPI Baud Rate Register
SPIRXEMU	0x00 7046	1	SPI Receive Emulation Buffer Register
SPIRXBUF	0x00 7047	1	SPI Serial Input Buffer Register
SPITXBUF	0x00 7048	1	SPI Serial Output Buffer Register
SPIDAT	0x00 7049	1	SPI Serial Data Register
SPIFFTX	0x00 704A	1	SPI FIFO Transmit Register

SPIFFCT	0x00 704C	1	SPI FIFO Control Register
SPIPRI	0x00 704F	1	SPI Priority Control Register

NOTE: The above registers are mapped to Peripheral Frame 2. This space only allows 16-bit accesses. 32-bit accesses produce undefined results.

Figure 4–11 is a block diagram of the SPI in slave mode.

†  $\overline{\text{SPISTE}}$  is driven low by the master for a slave device.

Figure 4–11. Serial Peripheral Interface Module Block Diagram (Slave Mode)

## 4.8 GPIO MUX

The GPIO Mux registers, are used to select the operation of shared pins on the F281x and C281x devices. The pins can be individually selected to operate as “Digital I/O” or connected to “Peripheral I/O” signals (via the GPxMUX registers). If selected for “Digital I/O” mode, registers are provided to configure the pin direction (via the GPxDIR registers) and to qualify the input signal to remove unwanted noise (via the GPxQUAL registers). Table 4-11 lists the GPIO Mux Registers.

**Table 4-11. GPIO Mux Registers†‡§**

† Reserved locations will return undefined values and writes will be ignored.

‡ Not all inputs will support input signal qualification.

§ These registers are EALLOW protected. This prevents spurious writes from overwriting the contents and corrupting the system.

If configured for "Digital I/O" mode, additional registers are provided for setting individual I/O signals (via the GPxSET registers), for clearing individual I/O signals (via the GPxCLEAR registers), for toggling individual I/O signals (via the GPxTOGGLE registers), or for reading/writing to the individual I/O signals (via the GPxDAT registers). Table 4-12 lists the GPIO Data Registers. For more information, see the *TMS320F28x System Control and Interrupts Reference Guide* (literature number SPRU078).

**Table 4-12. GPIO Data Registers†‡**

GPGTOGGLE	0x00 70FB	1	GPIO G Toggle Register
reserved	0x00 70FC 0x00 70FF	4	

† Reserved locations will return undefined values and writes will be ignored.

‡ These registers are NOT EALLOW protected. The above registers will typically be accessed regularly by the user.

Figure 4–12 shows how the various register bits select the various modes of operation.

NOTES:

- In the GPIO mode, when the GPIO pin is configured for output operation, reading the GPxDAT data register only gives the value written, not the value at the pin. In the peripheral mode, the state of the pin can be read through the GPxDAT register, provided the corresponding direction bit is zero (input mode).
- Some selected input signals are qualified by the SYSCLKOUT. The GPxQUAL register specifies the qualification sampling period. The sampling window is 6 samples wide and the output is only changed when all samples are the same (all 0's or all 1's). This feature removes unwanted spikes from the input signal.

Figure 4–12. Modes of Operation

**NOTE:**

The input function of the GPIO pin and the input path to the peripheral are always enabled. It is the output function of the GPIO pin that is multiplexed with the output path of the primary (peripheral) function. Since the output buffer of a pin connects back to the input buffer, any GPIO signal present at the pin will be propagated to the peripheral module as well. Therefore, when a pin is configured for GPIO operation, the corresponding peripheral functionality (and interrupt-generating capability) must be disabled. Otherwise, interrupts may be inadvertently triggered. This is especially critical when the PDPINTA and PDPINTB pins are used as GPIO pins, since a value of zero for GPDDAT.0 or GPDDAT.5 (PDPINTx) will put PWM pins in a high-impedance state. The CxTRIP and TxCTRIP pins will also put the corresponding PWM pins in high impedance, if they are driven low (as GPIO pins) and bit EXTCONx.0 = 1.

## 5 Development Support

Texas Instruments (TI) offers an extensive line of development tools for the C28x™ generation of DSPs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of F281x- and C281x-based applications:

### Software Development Tools

- Code Composer Studio™ Integrated Development Environment (IDE)
  - C/C++ Compiler
  - Code generation tools
  - Assembler/Linker
  - Cycle Accurate Simulator
- Application algorithms
- Sample applications code

### Hardware Development Tools

- 2812 eZdsp
- JTAG-based emulators – SPI515, XDS510PP, XDS510PP Plus, XDS510 USB
- Universal 5-V dc power supply
- Documentation and cables

### 5.1 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all [TMS320] DSP devices and support tools. Each [TMS320] DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., TMS320F2812GHH). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

**TMX** Experimental device that is not necessarily representative of the final device's electrical specifications

**TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification

**TMS/SM** Fully qualified production device

Support tool development evolutionary flow:

**TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.

**TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development–support tools are shipped against the following disclaimer:

“Developmental product is intended for internal evaluation purposes.”

TMS/SM devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PBK) and temperature range (for example, A). Figure 5–1 provides a legend for reading the complete device name for any TMS320x28x family member.

†BGA = Ball Grid Array  
 LQFP = Low-Profile Quad Flatpack

**Figure 5–1. TMS320x28x Device Nomenclature**

## 5.2 Documentation Support

Extensive documentation supports all of the TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets and data manuals, with design specifications; and hardware and software applications. Useful reference documentation includes:

**TMS320C28x DSP CPU and Instruction Set Reference Guide** (literature number SPRU430) describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x™ fixed-point digital signal processors (DSPs). It also describes emulation features available on these DSPs.

**TMS320C28x Peripheral Reference Guide** (literature number SPRU566) describes the peripheral reference guides of the 28x digital signal processors (DSPs).

**TMS320C28x Analog-to-Digital Converter (ADC) Reference Guide** (literature number SPRU060) describes the ADC module. The module is a 12-bit pipelined ADC. The analog circuits of this converter, referred to as the core in this document, include the front-end analog multiplexers (MUXs), sample-and-hold (S/H) circuits, the conversion core, voltage regulators, and other analog supporting circuits. Digital circuits, referred to as the wrapper in this document, include programmable conversion sequencer, result registers, interface to analog circuits, interface to device peripheral bus, and interface to other on-chip modules.

**TMS320C28x Boot ROM Reference Guide** (literature number SPRU095) describes the purpose and features of the bootloader (factory-programmed boot-loading software). It also describes other contents of the device on-chip boot ROM and identifies where all of the information is located within that memory.

**TMS320C28x Enhanced Controller Area Network (eCAN) Reference Guide** (literature number SPRU074) describes the eCAN that uses established protocol to communicate serially with other controllers in electrically noisy environments. With 32 fully configurable mailboxes and time-stamping feature, the eCAN module provides a versatile and robust serial communication interface. The eCAN module implemented in the C28x DSP is compatible with the CAN 2.0B standard (active).

**TMS320C28x Event Manager (EV) Reference Guide** (literature number SPRU065) describes the EV modules that provide a broad range of functions and features that are particularly useful in motion control and motor control applications. The EV modules include general-purpose (GP) timers, full-compare/PWM units, capture units, and quadrature-encoder pulse (QEP) circuits.

**TMS320C28x External Interface (XINTF) Reference Guide** (literature number SPRU067) describes the external interface (XINTF) of the 28x digital signal processors (DSPs).

**TMS320C28x Multichannel Buffered Serial Ports (McBSPs) Reference Guide** (literature number SPRU061) describes the McBSP available on the C28x devices. The McBSPs allow direct interface between a DSP and other devices in a system.

**TMS320C28x Serial Communication Interface (SCI) Reference Guide** (literature number SPRU051) describes the SCI that is a two-wire asynchronous serial port, commonly known as a UART. The SCI modules support digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format.

**TMS320C28x Serial Peripheral Interface (SPI) Reference Guide** (literature number SPRU059) describes the SPI – a high-speed synchronous serial input/output (I/O) port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmed bit-transfer rate. The SPI is used for communications between the DSP controller and external peripherals or another controller.

**TMS320C28x System Control and Interrupts Reference Guide** (literature number SPRU078) describes the various interrupts and system control features of the 28x digital signal processors (DSPs).

**3.3 V DSP for Digital Motor Control Application Report** (literature number SPRA550). New generations of motor control digital signal processors (DSPs) lower their supply voltages from 5 V to 3.3 V to offer higher performance at lower cost. Replacing traditional 5-V digital control circuitry by 3.3-V designs introduce no additional system cost and no significant complication in interfacing with TTL and CMOS compatible components, as well as with mixed voltage ICs such as power transistor gate drivers. Just like 5-V based designs, good engineering practice should be exercised to minimize noise and EMI effects by proper component layout and PCB design when 3.3-V DSP, ADC, and digital circuitry are used in a mixed signal environment, with high and low voltage analog and switching signals, such as a motor control system. In addition, software techniques such as Random PWM method can be used by special features of the Texas Instruments (TI) TMS320x24xx DSP controllers to significantly reduce noise effects caused by EMI radiation.

This application report reviews designs of 3.3-V DSP versus 5-V DSP for low HP motor control applications. The application report first describes a scenario of a 3.3-V-only motor controller indicating that for most applications, no significant issue of interfacing between 3.3 V and 5 V exists. Cost-effective 3.3-V – 5-V interfacing techniques are then discussed for the situations where such interfacing is needed. On-chip 3.3-V ADC versus 5-V ADC is also discussed. Sensitivity and noise effects in 3.3-V and 5-V ADC conversions are addressed. Guidelines for component layout and printed circuit board (PCB) design that can reduce system's noise and EMI effects are summarized in the last section.

**The TMS320C28x Instruction Set Simulator Technical Overview** (literature number SPRU608) describes the simulator, available within the Code Composer Studio for TMS320C2000 IDE, that simulates the instruction set of the C28x core.

**TMS320C28x DSP/BIOS Application Programming Interface (API) Reference Guide** (literature number SPRU625) describes development using DSP/BIOS.

**TMS320C28x Assembly Language Tools User's Guide** (literature number SPRU513) describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x™ device.

**TMS320C28x Optimizing C Compiler User's Guide** (literature number SPRU514) describes the TMS320C28x™ C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320™ DSP assembly language source code for the TMS320C28x device.

A series of DSP textbooks is published by Prentice-Hall and John Wiley & Sons to support digital signal processing research and education. The TMS320™ DSP newsletter, *Details on Signal Processing*, is published quarterly and distributed to update TMS320™ DSP customers on product information.

Updated information on the TMS320™ DSP controllers can be found on the worldwide web at: <http://www.ti.com>.

To send comments regarding this TMS320F281x/TMS320C281x data manual (literature number SPRS174), use the [comments@books.sc.ti.com](mailto:comments@books.sc.ti.com) email address, which is a repository for feedback. For questions and support, contact the Product Information Center listed at the <http://www.ti.com/sc/docs/pic/home.htm> site.

## 6 Electrical Specifications

This section provides the absolute maximum ratings and the recommended operating conditions for the 320F281x and 320C281x DSPs.

### 6.1 Absolute Maximum Ratings

Unless otherwise noted, the list of absolute maximum ratings are specified over operating temperature ranges. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Section 6.2 is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to  $V_{SS}$ .

Supply voltage range, $V_{DDIO}$ , $V_{DDA1}$ , $V_{DDA2}$ , $V_{DDAIO}$ , and $AV_{DDREFBG}$ .....	- 0.3 V to 4.6 V
Supply voltage range, $V_{DD}$ , $V_{DD1}$ .....	- 0.5 V to 2.5 V
$V_{DD3VFL}$ range .....	- 0.3 V to 4.6 V
Input voltage range, $V_{IN}$ .....	- 0.3 V to 4.6 V
Output voltage range, $V_O$ .....	- 0.3 V to 4.6 V
Input clamp current, $I_{IK}$ ( $V_{IN} < 0$ or $V_{IN} > V_{DDIO}$ ) <sup>†</sup> .....	$\pm 20$ mA
Output clamp current, $I_{OK}$ ( $V_O < 0$ or $V_O > V_{DDIO}$ ) .....	$\pm 20$ mA
Operating ambient temperature ranges, $T_A$ : M version (GHH, PGF) <sup>‡</sup> .....	- 55°C to 125°C
Storage temperature range, $T_{Stg}$ <sup>‡</sup> .....	- 65°C to 150°C

<sup>†</sup> Continuous clamp current per pin is  $\pm 2$  mA

<sup>‡</sup> Long-term high-temperature storage and/or extended use at maximum temperature conditions may result in a reduction of overall device life.

For additional information, see *IC Package Thermal Metrics Application Report* (literature number SPRA953) and *Reliability Data for TMS320LF24x and TMS320F281x Devices Application Report* (literature number SPRA963).

## 6.2 Recommended Operating Conditions<sup>†</sup>

			MIN	NOM	MAX	UNIT
$V_{DDIO}$	Device supply voltage, I/O		3.14	3.3	3.47	V
$V_{DD}$ , $V_{DD1}$	Device supply voltage, CPU	1.8 V (135 MHz)	1.71	1.8	1.89	V
		1.9 V (150 MHz)	1.81	1.9	2	
$V_{SS}$	Supply ground			0		V
$V_{DDA1}$ , $V_{DDA2}$ , $AV_{DDREFBG}$ , $V_{DDAIO}$	ADC supply voltage		3.14	3.3	3.47	V
$V_{DD3VFL}$	Flash programming supply voltage		3.14	3.3	3.47	V
$f_{SYSCLKOUT}$	Device clock frequency (system clock)	$V_{DD} = 1.9 \text{ V} \pm 5\%$	2	150		MHz
		$V_{DD} = 1.8 \text{ V} \pm 5\%$	2	135		
$V_{IH}$	High-level input voltage	All inputs except XCLKIN	2	$V_{DDIO}$		V
		XCLKIN (@ 50 $\mu\text{A}$ max)	$0.7V_{DD}$	$V_{DD}$		
$V_{IL}$	Low-level input voltage	All inputs except XCLKIN	0.8			V
		XCLKIN (@ 50 $\mu\text{A}$ max)		$0.3V_{DD}$		
$I_{OH}$	High-level output source current, $V_{OH} = 2.4 \text{ V}$	All I/Os except Group 2			- 4	mA
		Group 2 <sup>‡</sup>			- 8	
$I_{OL}$	Low-level output sink current, $V_{OL} = V_{OL \text{ MAX}}$	All I/Os except Group 2			4	mA
		Group 2 <sup>‡</sup>			8	
$T_A$	Ambient temperature	M version	See Figure 6-1 and Figure 6-2	- 55	125	$^{\circ}\text{C}$

<sup>†</sup> See Section 6.8 for power sequencing of  $V_{DDIO}$ ,  $V_{DDAIO}$ ,  $V_{DD}$ ,  $V_{DDA1}/V_{DDA2}/AV_{DDREFBG}$ , and  $V_{DD3VFL}$ .

<sup>‡</sup> Group 2 pins are as follows: XINTF pins, PDPINTA, TDO, XCLKOUT, XF, EMU0, and EMU1.

In Revision C, EVA (GPIOA0–GPIOA15) and GPIOD0 are 4 mA drive.

Figure 6-1. FIT Rate vs Operating Junction Temperature

Figure 6-2. Package Lifetime vs Operating Junction Temperature

### 6.3 Electrical Characteristics Over Recommended Operating Conditions (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT		
V <sub>OH</sub>	High-level output voltage	I <sub>OH</sub> = I <sub>OHMAX</sub>		2.4			V		
		I <sub>OH</sub> = 50 $\mu$ A		V <sub>DDIO</sub> - 0.2					
V <sub>OL</sub>	Low-level output voltage	I <sub>OL</sub> = I <sub>OLMAX</sub>		0.4			V		
I <sub>IL</sub>	Input current (low level)	With pullup	V <sub>DDIO</sub> = 3.3 V, V <sub>IN</sub> = 0 V	All I/Os <sup>§</sup> (including XRS) except EVB		-80	-140	-190	$\mu$ A
				GPIOB/EVB		-13	-25	-35	
I <sub>IH</sub>	Input current (high level)	With pullup	V <sub>DDIO</sub> = 3.3 V, V <sub>IN</sub> = V <sub>DD</sub>		$\pm 2$			$\mu$ A	
			With pulldown <sup>¶</sup>		V <sub>DDIO</sub> = 3.3 V, V <sub>IN</sub> = V <sub>DD</sub>		28	50	80
I <sub>OZ</sub>	Output current, high-impedance state (off-state)	V <sub>O</sub> = V <sub>DDIO</sub> or 0 V		$\pm 2$			$\mu$ A		
C <sub>i</sub>	Input capacitance			2			pF		
C <sub>o</sub>	Output capacitance			3			pF		

<sup>§</sup> The following pins have no internal PU/PD: GPIOE0, GPIOE1, GPIOF0, GPIOF1, GPIOF2, GPIOF3, GPIOF12, GPIOG4, and GPIOG5.

<sup>¶</sup> The following pins have an internal pulldown: XMP/MC, TESTSEL, and TRST.

#### 6.4 Current Consumption by Power-Supply Pins Over Recommended Operating Conditions During Low-Power Modes at 150-MHz SYSCLKOUT (320F281x)

MODE	TEST CONDITIONS	I <sub>DD</sub>		I <sub>DDIO</sub>		I <sub>DD3VFL</sub>		I <sub>DDA</sub> <sup>†</sup>	
		TYP	MAX <sup>‡</sup>	TYP	MAX <sup>‡</sup>	TYP	MAX <sup>‡</sup>	TYP	MAX <sup>‡</sup>
Operational	All peripheral clocks are enabled. All PWM pins are toggled at 100 kHz. Data is continuously transmitted out of the SCIA, SCIB, and CAN ports. The hardware multiplier is exercised. Code is running out of flash with 5 wait-states.	195 mA	230 mA	15 mA	30 mA	40 mA	45 mA	40 mA	50 mA
IDLE	<ul style="list-style-type: none"> <li>– Flash is powered down</li> <li>– XCLKOUT is turned off</li> <li>– All peripheral clocks are on, except ADC</li> </ul>	125 mA	150 mA	5 mA	10 mA	2 $\mu$ A	4 $\mu$ A	1 $\mu$ A	20 $\mu$ A
STANDBY	<ul style="list-style-type: none"> <li>– Flash is powered down</li> <li>– Peripheral clocks are turned off</li> <li>– Pins without an internal PU/PD are tied high/low</li> </ul>	5 mA	10 mA	5 $\mu$ A	20 $\mu$ A	2 $\mu$ A	4 $\mu$ A	1 $\mu$ A	20 $\mu$ A
HALT	<ul style="list-style-type: none"> <li>– Flash is powered down</li> <li>– Peripheral clocks are turned off</li> <li>– Pins without an internal PU/PD are tied high/low</li> <li>– Input clock is disabled</li> </ul>	70 $\mu$ A		5 $\mu$ A	20 $\mu$ A	2 $\mu$ A	4 $\mu$ A	1 $\mu$ A	20 $\mu$ A

<sup>†</sup>I<sub>DDA</sub> includes current into V<sub>DDA1</sub>, V<sub>DDA2</sub>, AV<sub>DDREFBG</sub>, and V<sub>DDAIO</sub> pins.

<sup>‡</sup>MAX numbers are at 125°C, and max voltage (V<sub>DD</sub> = 2.0 V; V<sub>DDIO</sub>, V<sub>DD3VFL</sub>, V<sub>DDA</sub> = 3.6 V).

**NOTE:**

HALT and STANDBY modes cannot be used when the PLL is disabled.

## 6.5 Current Consumption by Power-Supply Pins Over Recommended Operating Conditions During Low-Power Modes at 150-MHz SYSCLKOUT (320C281x)

MODE	TEST CONDITIONS	I <sub>DD</sub>		I <sub>DDIO</sub>		I <sub>DDA</sub> <sup>†</sup>	
		TYP	MAX‡	TYP	MAX‡	TYP	MAX‡
Operational	All peripheral clocks are enabled. All PWM pins are toggled at 100 kHz. Data is continuously transmitted out of the SCIA, SCIB, and CAN ports. The hardware multiplier is exercised. Code is running out of ROM with 5 wait-states.	160 mA		10 mA		40 mA	
IDLE	<ul style="list-style-type: none"> <li>– XCLKOUT is turned off</li> <li>– All peripheral clocks are on, except ADC</li> </ul>	125 mA		5 mA		1 $\mu$ A	
STANDBY	<ul style="list-style-type: none"> <li>– Peripheral clocks are turned off</li> <li>– Pins without an internal PU/PD are tied high/low</li> </ul>	3 mA		5 $\mu$ A		1 $\mu$ A	
HALT	<ul style="list-style-type: none"> <li>– Peripheral clocks are turned off</li> <li>– Pins without an internal PU/PD are tied high/low</li> <li>– Input clock is disabled</li> </ul>	10 $\mu$ A		5 $\mu$ A		1 $\mu$ A	

<sup>†</sup> I<sub>DDA</sub> includes current into V<sub>DDA1</sub>, V<sub>DDA2</sub>, AV<sub>DDREFBG</sub>, and V<sub>DDAIO</sub> pins.

## 6.6 Current Consumption Graphs

NOTES:

- Flash uses five wait-states for paged and random access for frequencies above 5 MHz. For frequencies of 1 to 5 MHz, it was made to operate at zero wait-states.
- ADC operates at SYSCLKOUT/6 for frequencies above 5 MHz. For frequencies of 1 to 5 MHz, it was made to operate at SYSCLKOUT.

Figure 6–3. F2812/F2811/F2810 Typical Current Consumption (With Peripheral Clocks Enabled)

## 6.7 Reducing Current Consumption

28x DSPs incorporate a unique method to reduce the device current consumption. A reduction in current consumption can be achieved by turning off the clock to any peripheral module which is not used in a given application. Table 6–1 indicates the typical reduction in current consumption achieved by turning off the clocks to various peripherals.

**Table 6-1. Typical Current Consumption by Various Peripherals (at 150 MHz)†**

PERIPHERAL MODULE	I <sub>DD</sub> CURRENT REDUCTION (mA)
eCAN	12
EVA	6
EVB	6
ADC	8‡
SCI	4
SPI	5
McBSP	13

† All peripheral clocks are disabled upon reset. Writing to/reading from peripheral registers is possible only after the peripheral clocks are turned on.

‡ This number represents the current drawn by the digital portion of the ADC module. Turning off the clock to the ADC module results in the elimination of the current drawn by the analog portion of the ADC ( $I_{CCA}$ ) as well.

## 6.8 Power Sequencing Requirements

320F2812/F2811/F2810/C2812/C2811/C2810 silicon requires dual voltages (1.8-V or 1.9-V and 3.3-V) to power up the CPU, Flash, ROM, ADC, and the I/Os. To ensure the correct reset state for all modules during power up, there are some requirements to be met while powering up/powering down the device. The current F2812 silicon reference schematics (Spectrum Digital Incorporated eZdsp™ board) suggests two options for the power sequencing circuit.

- Option 1:

In this approach, an external power sequencing circuit enables  $V_{DDIO}$  first, then  $V_{DD}$  and  $V_{DD1}$  (1.8 V or 1.9 V). After 1.8 V (or 1.9 V) ramps, the 3.3 V for Flash ( $V_{DD3VFL}$ ) and ADC ( $V_{DDA1}/V_{DDA2}/AV_{DDREFBG}$ ) modules are ramped up. While option 1 is still valid, TI has simplified the requirement. Option 2 is the recommended approach.

- Option 2:

Enable power to all 3.3-V supply pins ( $V_{DDIO}$ ,  $V_{DD3VFL}$ ,  $V_{DDA1}/V_{DDA2}/V_{DDAIO}/AV_{DDREFBG}$ ) and then ramp 1.8 V (or 1.9 V) ( $V_{DD}/V_{DD1}$ ) supply pins.

1.8 V or 1.9 V ( $V_{DD}/V_{DD1}$ ) should not reach 0.3 V until  $V_{DDIO}$  has reached 2.5 V. This ensures the reset signal from the I/O pin has propagated through the I/O buffer to provide power-on reset to all the modules inside the device. See Figure 6-9 for power-on reset timing.

- Power-Down Sequencing:

During power-down, the device reset should be asserted low (8  $\mu$ s, minimum) before the  $V_{DD}$  supply reaches 1.5 V. This will help to keep on-chip flash logic in reset prior to the  $V_{DDIO}/V_{DD}$  power supplies ramping down. It is recommended that the device reset control from “Low-Dropout (LDO)” regulators or voltage supervisors be used to meet this constraint. LDO regulators that facilitate power-sequencing (with the aid of additional external components) may be used to meet the power sequencing requirement. See [www.spectrumdigital.com](http://www.spectrumdigital.com) for F2812 eZdsp™ schematics and updates.

**Table 6-2. Recommended “Low-Dropout Regulators”**

SUPPLIER	PART NUMBER
Texas Instruments	TPS767D301

**NOTE:**

The GPIO pins are undefined until  $V_{DD} = 1$  V and  $V_{DDIO} = 2.5$  V.

†  $V_{DD\_3.3V} = V_{DDIO}, V_{DD3VFL}, V_{DDAIO}, V_{DDA1}, V_{DDA2}, AV_{DDREFBG}$

‡  $V_{DD\_1.8V} = V_{DD}, V_{DD1}$

NOTES:

- 1.8-V (or 1.9 V) supply should ramp after the 3.3-V supply reaches at least 2.5 V.
- Reset (**XRS**) should remain low until supplies and clocks are stable. See Figure 6-9, Power-on Reset in Microcomputer Mode ( $XMP/MC = 0$ ), for minimum requirements.
- Voltage supervisor or LDO reset control will trip reset (**XRS**) first when the 3.3-V supply is off regulation. Typically, this occurs a few milliseconds before the 1.8-V (or 1.9 V) supply reaches 1.5 V.
- Keeping reset low (**XRS**) at least  $8\text{ }\mu\text{s}$  prior to the 1.8-V (or 1.9 V) supply reaching 1.5 V will keep the flash module in complete reset before the supplies ramp down.
- Since the state of GPIO pins is undefined until the 1.8-V (or 1.9 V) supply reaches at least 1 V, this supply should be ramped as quickly as possible (after the 3.3-V supply reaches at least 2.5 V).
- Other than the power supply pins, no pin should be driven before the 3.3-V rail has been fully powered up.

Figure 6-4. F2812/F2811/F2810 Typical Power-Up and Power-Down Sequence – Option 2

## 6.9 Signal Transition Levels

Note that some of the signals use different reference voltages, see the recommended operating conditions table. Output levels are driven to a minimum logic-high level of 2.4 V and to a maximum logic-low level of 0.4 V.

Figure 6–5 shows output levels.

Figure 6–5. Output Levels

Output transition times are specified as follows:

- For a *high-to-low transition*, the level at which the output is said to be no longer high is below 80% of the total voltage range and lower and the level at which the output is said to be low is 20% of the total voltage range and lower.
- For a *low-to-high transition*, the level at which the output is said to be no longer low is 20% of the total voltage range and higher and the level at which the output is said to be high is 80% of the total voltage range and higher.

Figure 6–6 shows the input levels.

Figure 6–6. Input Levels

Input transition times are specified as follows:

- For a *high-to-low transition* on an input signal, the level at which the input is said to be no longer high is 90% of the total voltage range and lower and the level at which the input is said to be low is 10% of the total voltage range and lower.
- For a *low-to-high transition* on an input signal, the level at which the input is said to be no longer low is 10% of the total voltage range and higher and the level at which the input is said to be high is 90% of the total voltage range and higher.

**NOTE:** See the individual timing diagrams for levels used for testing timing parameters.

## 6.10 Timing Parameter Symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

Lowercase subscripts and their meanings:

a	access time
c	cycle time (period)
d	delay time
f	fall time
h	hold time
r	rise time
su	setup time
t	transition time
v	valid time
w	pulse duration (width)

Letters and symbols and their meanings:

H	High
L	Low
V	Valid
X	Unknown, changing, or don't care level
Z	High impedance

## 6.11 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

## 6.12 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 6-7. 3.3-V Test Load Circuit

## 6.13 Device Clock Table

This section provides the timing requirements and switching characteristics for the various clock options available on the F281x and C281x DSPs. Table 6-3 lists the cycle times of various clocks.

**Table 6-3. 320F281x and 320C281x Clock Table and Nomenclature**

		MIN	NOM	MAX	UNIT
On-chip oscillator clock	$t_c(\text{OSC})$ , Cycle time	28.6	50	ns	
	Frequency	20	35	MHz	
XCLKIN	$t_c(\text{Cl})$ , Cycle time	6.67	250	ns	
	Frequency	4	150	MHz	
SYSCLKOUT	$t_c(\text{SCO})$ , Cycle time	6.67	500	ns	
	Frequency	2	150	MHz	
XCLKOUT	$t_c(\text{XCO})$ , Cycle time	6.67	2000	ns	
	Frequency	0.5	150	MHz	
HSPCLK	$t_c(\text{HCO})$ , Cycle time	6.67	13.3‡	ns	
	Frequency		75‡	150	MHz
LSPCLK	$t_c(\text{LCO})$ , Cycle time	13.3	26.6‡	ns	
	Frequency		37.5‡	75	MHz
ADC clock	$t_c(\text{ADCCLK})$ , Cycle time†	40		ns	
	Frequency			25	MHz
SPI clock	$t_c(\text{SPC})$ , Cycle time	50		ns	
	Frequency			20	MHz
McBSP	$t_c(\text{CKG})$ , Cycle time	50		ns	
	Frequency			20	MHz
XTIMCLK	$t_c(\text{XTIM})$ , Cycle time	6.67		ns	
	Frequency			150	MHz

† The maximum value for ADCCLK frequency is 25 MHz. For SYSCLKOUT values of 25 MHz or lower, ADCCLK has to be SYSCLKOUT/2 or lower.  
 ADCCLK = SYSCLKOUT is not a valid mode for any value of SYSCLKOUT.

‡ This is the default reset value if SYSCLKOUT = 150 MHz.

## 6.14 Clock Requirements and Characteristics

### 6.14.1 Input Clock Requirements

The clock provided at the XCLKIN pin generates the internal CPU clock cycle.

**Table 6-4. Input Clock Frequency**

PARAMETER		MIN	TYP	MAX	UNIT
$f_x$	Input clock frequency	Resonator	20	35	MHz
		Crystal	20	35	
		XCLKIN	4	150	
$f_l$	Limp mode clock frequency		2		MHz

**Table 6-5. XCLKIN Timing Requirements – PLL Bypassed or Enabled**

NO.				MIN	MAX	UNIT	
C8	$t_c(Cl)$	Cycle time, XCLKIN			6.67	250	
C9	$t_f(Cl)$	Fall time, XCLKIN	Up to 30 MHz	6	ns		
			30 MHz to 150 MHz				
C10	$t_r(Cl)$	Rise time, XCLKIN	Up to 30 MHz	6	ns		
			30 MHz to 150 MHz				
C11	$t_w(ClL)$	Pulse duration, X1/XCLKIN low as a percentage of $t_c(Cl)$			40	60	
C12	$t_w(ClH)$	Pulse duration, X1/XCLKIN high as a percentage of $t_c(Cl)$			40	60	

**Table 6-6. XCLKIN Timing Requirements – PLL Disabled**

NO.				MIN	MAX	UNIT
C8	$t_c(Cl)$	Cycle time, XCLKIN			6.67	250
C9	$t_f(Cl)$	Fall time, XCLKIN	Up to 30 MHz	6	ns	
			30 MHz to 150 MHz			
C10	$t_r(Cl)$	Rise time, XCLKIN	Up to 30 MHz	6	ns	
			30 MHz to 150 MHz			
C11	$t_w(ClL)$	Pulse duration, X1/XCLKIN low as a percentage of $t_c(Cl)$	XCLKIN $\leq$ 120 MHz	40	60	%
			120 $<$ XCLKIN $\leq$ 150 MHz			
C12	$t_w(ClH)$	Pulse duration, X1/XCLKIN high as a percentage of $t_c(Cl)$	XCLKIN $\leq$ 120 MHz	40	60	%
			120 $<$ XCLKIN $\leq$ 150 MHz			

**Table 6-7. Possible PLL Configuration Modes**

PLL MODE	REMARKS	SYSCLKOUT
PLL Disabled	Invoked by tying XPLLDIS pin low upon reset. PLL block is completely disabled. Clock input to the CPU (CLKIN) is directly derived from the clock signal present at the X1/XCLKIN pin.	XCLKIN
PLL Bypassed	Default PLL configuration upon power-up, if PLL is not disabled. The PLL itself is bypassed. However, the /2 module in the PLL block divides the clock input at the X1/XCLKIN pin by two before feeding it to the CPU.	XCLKIN/2
PLL Enabled	Achieved by writing a non-zero value "n" into PLLCR register. The /2 module in the PLL block now divides the output of the PLL by two before feeding it to the CPU.	(XCLKIN * n) / 2

### 6.14.2 Output Clock Characteristics

Table 6-8. XCLKOUT Switching Characteristics (PLL Bypassed or Enabled)†‡

No.	PARAMETER	MIN	TYP	MAX	UNIT
C1	$t_c(XCO)$ Cycle time, XCLKOUT	6.67§			ns
C3	$t_f(XCO)$ Fall time, XCLKOUT	2			ns
C4	$t_r(XCO)$ Rise time, XCLKOUT	2			ns
C5	$t_w(XCOL)$ Pulse duration, XCLKOUT low	H-2		H+2	ns
C6	$t_w(XCOH)$ Pulse duration, XCLKOUT high	H-2		H+2	ns
C7	$t_p$ PLL lock time¶	131072 $t_c(Cl)$			ns

† A load of 40 pF is assumed for these parameters.

‡  $H = 0.5t_c(XCO)$

§ The PLL must be used for maximum frequency operation.

¶ This parameter has changed from 4096 XCLKIN cycles in the earlier revisions of the silicon.

NOTES: A. The relationship of XCLKIN to XCLKOUT depends on the divide factor chosen. The waveform relationship shown in Figure 6-8 is intended to illustrate the timing parameters only and may differ based on configuration.  
 B. XCLKOUT configured to reflect SYSCLKOUT.

Figure 6-8. Clock Timing

### 6.15 Reset Timing

Table 6-9. Reset (XRS) Timing Requirements†

		MIN	NOM	MAX	UNIT
$t_w(RSL1)$	Pulse duration, stable XCLKIN to $\overline{XRS}$ high		$8t_c(Cl)$		cycles
$t_w(RSL2)$	Pulse duration, $\overline{XRS}$ low	Warm reset	$8t_c(Cl)$		cycles
		WD-initiated reset	$512t_c(Cl)$		
$t_w(WDRS)$	Pulse duration, reset pulse generated by watchdog		$512t_c(Cl)$		cycles
$t_d(EX)$	Delay time, address/data valid after $\overline{XRS}$ high		$32t_c(Cl)$		cycles
$t_{OSCST}^‡$	Oscillator start-up time		1	10	ms
$t_{su}(XPLLDIS)$	Setup time for $\overline{XPLLDIS}$ pin		$16t_c(Cl)$		cycles
$t_h(XPLLDIS)$	Hold time for $\overline{XPLLDIS}$ pin		$16t_c(Cl)$		cycles
$t_h(XMP/MC)$	Hold time for XMP/MC pin		$16t_c(Cl)$		cycles
$t_h(\text{boot-mode})$	Hold time for boot-mode pins		$2520t_c(Cl)$ §		cycles

† If external oscillator/clock source are used, reset time has to be low at least for 1 ms after  $V_{DD}$  reaches 1.5 V.

‡ Dependent on crystal/resonator and board design.

§ The boot ROM reads the password locations. Therefore, this timing requirement includes the wakeup time for flash. See the *TMS320F28x Boot ROM Reference Guide* (literature number SPRU095) and *TMS320F28x System Control and Interrupts Reference Guide* (literature number SPRU078) for further information.

NOTES:

- The state of the GPIO pins is undefined (i.e., they could be input or output) until the 1.8-V (or 1.9-V) supply reaches at least 1 V and 3.3-V supply reaches 2.5 V.
- $V_{DDAn} - V_{DDA1}/V_{DDA2}$  and  $A_{VDDREFBG}$
- Upon power up,  $SYSCLKOUT$  is  $XCLKIN/2$  if the PLL is enabled. Since both the  $XTIMCLK$  and  $CLKMODE$  bits in the  $XINTCNF2$  register come up with a reset state of 1,  $SYSCLKOUT$  is further divided by 4 before it appears at  $XCLKOUT$ . This explains why  $XCLKOUT = XCLKIN/8$  during this phase.
- After reset, the Boot ROM code executes instructions for 1260  $SYSCLKOUT$  cycles ( $SYSCLKOUT = XCLKIN/2$ ) and then samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function in ROM. The BOOT Mode pins should be held high/low for at least 2520  $XCLKIN$  cycles from boot ROM execution time for proper selection of Boot modes.

If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current  $SYSCLKOUT$  speed. The  $SYSCLKOUT$  will be based on user environment and could be with or without PLL enabled.

Figure 6-9. Power-on Reset in Microcomputer Mode ( $XMP/MC = 0$ ) (See Note A)

NOTES:

- Upon power up,  $SYSCLKOUT$  is  $XCLKIN/2$  if the PLL is enabled. Since both the  $XTIMCLK$  and  $CLKMODE$  bits in the  $XINTCNF2$  register come up with a reset state of 1,  $SYSCLKOUT$  is further divided by 4 before it appears at  $XCLKOUT$ . This explains why  $XCLKOUT = XCLKIN/8$  during this phase.
- The state of the GPIO pins is undefined (i.e., they could be input or output) until the 1.8-V (or 1.9-V) supply reaches at least 1 V and 3.3-V supply reaches 2.5 V..

Figure 6–10. Power-on Reset in Microprocessor Mode ( $XMP/MC = 1$ )

† After reset, the Boot ROM code executes instructions for 1260 SYSCLKOUT cycles ( $\text{SYSCLKOUT} = \text{XCLKIN}/2$ ) and then samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function in ROM. The BOOT Mode pins should be held high/low for at least 2520 XCLKIN cycles from boot ROM execution time for proper selection of Boot modes.

If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.

Figure 6–11. Warm Reset in Microcomputer Mode

Figure 6–12. Effect of Writing Into PLLCR Register

## 6.16 Low-Power Mode Wakeup Timing

Table 6–10 is also the IDLE Mode Wake-Up Timing Requirements table.

**Table 6–10. IDLE Mode Switching Characteristics**

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_w(\text{WAKE-INT})$	Pulse duration, external wake-up signal	Without input qualifier	$2 * t_c(\text{SCO})$			Cycles
		With input qualifier	$1 * t_c(\text{SCO}) + \text{IQT}^\dagger$			Cycles
$t_d(\text{WAKE-IDLE})$	Delay time, external wake signal to program execution resume‡					
	– Wake-up from Flash – Flash module in active state	Without input qualifier	$8 * t_c(\text{SCO})$			Cycles
	– Wake-up from Flash – Flash module in active state	With input qualifier	$8 * t_c(\text{SCO}) + \text{IQT}^\dagger$			Cycles
	– Wake-up from Flash – Flash module in sleep state	Without input qualifier	$1050 * t_c(\text{SCO})$			Cycles
	– Wake-up from Flash – Flash module in sleep state	With input qualifier	$1050 * t_c(\text{SCO}) + \text{IQT}^\dagger$			Cycles
	– Wake-up from SARAM	Without input qualifier	$8 * t_c(\text{SCO})$			Cycles
	– Wake-up from SARAM	With input qualifier	$8 * t_c(\text{SCO}) + \text{IQT}^\dagger$			Cycles

† Input Qualification Time (IQT) =  $[5 \times \text{QUALPRD} \times 2] * t_c(\text{SCO})$

‡ This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. Execution of an ISR (triggered by the wake-up) signal involves additional latency.

† XCLKOUT = SYSCLKOUT  
‡ WAKE INT can be any enabled interrupt,  $\overline{\text{WDINT}}$ ,  $\overline{\text{XNMI}}$ , or  $\overline{\text{XRS}}$ .

**Figure 6–13. IDLE Entry and Exit Timing**

Table 6–11 is also the STANDBY Mode Wake-Up Timing Requirements table.

Table 6-11. STANDBY Mode Switching Characteristics

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_d(\text{IDLE-XCOH})$	Delay time, IDLE instruction executed to XCLKOUT high		$32 * t_c(\text{SCO})$	$12 * t_c(\text{CI})$	Cycles
$t_w(\text{WAKE-INT})$	Pulse duration, external wake-up signal	Without input qualifier	$12 * t_c(\text{CI})$		Cycles
	With input qualifier		$(2 + \text{QUALSTDBY})^\dagger * t_c(\text{CI})$		Cycles
$t_d(\text{WAKE-STBY})$	Delay time, external wake signal to program execution resume‡				
	– Wake-up from Flash – Flash module in active state	Without input qualifier	$12 * t_c(\text{CI})$		Cycles
	– Wake-up from Flash – Flash module in active state	With input qualifier	$12 * t_c(\text{CI}) + t_w(\text{WAKE-INT})$		Cycles
	– Wake-up from Flash – Flash module in sleep state	Without input qualifier	$1125 * t_c(\text{SCO})$		Cycles
	– Wake-up from Flash – Flash module in sleep state	With input qualifier	$1125 * t_c(\text{SCO}) + t_w(\text{WAKE-INT})$		Cycles
	– Wake-up from SARAM	Without input qualifier	$12 * t_c(\text{CI})$		Cycles
	– Wake-up from SARAM	With input qualifier	$12 * t_c(\text{CI}) + t_w(\text{WAKE-INT})$		Cycles

† QUALSTDBY is a 6-bit field in the LPMCR0 register.

‡ This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. Execution of an ISR (triggered by the wake-up) signal involves additional latency.

NOTES: A. IDLE instruction is executed to put the device into STANDBY mode.  
 B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for approximately 32 cycles before being turned off. This 32-cycle delay enables the CPU pipe and any other pending operations to flush properly.  
 C. The device is now in STANDBY mode.  
 D. The external wake-up signal is driven active (negative edge triggered shown as an example).  
 E. After a latency period, the STANDBY mode is exited.  
 F. Normal operation resumes. The device will respond to the interrupt (if enabled).

Figure 6-14. STANDBY Entry and Exit Timing

Table 6-12. HALT Mode Switching Characteristics

PARAMETER		MIN	TYP	MAX	UNIT
$t_d(\text{IDLE-XCOH})$	Delay time, IDLE instruction executed to XCLKOUT high	$32 * t_c(\text{SCO})$	$45 * t_c(\text{SCO})$		Cycles
$t_w(\text{WAKE-XNMI})$	Pulse duration, XNMI wakeup signal	$2 * t_c(\text{Cl})$			Cycles
$t_w(\text{WAKE-XRS})$	Pulse duration, $\overline{\text{XRS}}$ wakeup signal	$8 * t_c(\text{Cl})$			Cycles
$t_p$	PLL lock-up time			$131\,072 * t_c(\text{Cl})$	Cycles
$t_d(\text{wake})$	Delay time, PLL lock to program execution resume				
	– Wake-up from flash	$1125 * t_c(\text{SCO})$			Cycles
	– Flash module in sleep state	$35 * t_c(\text{SCO})$			Cycles

† XCLKOUT = SYSCLKOUT

NOTES:

- IDLE instruction is executed to put the device into HALT mode.
- The PLL block responds to the HALT signal. SYSCLKOUT is held for another 32 cycles before the oscillator is turned off and the CLKIN to the core is stopped. This 32-cycle delay enables the CPU pipe and any other pending operations to flush properly.
- Clocks to the device are turned off and the internal oscillator and PLL are shut down. The device is now in HALT mode and consumes absolute minimum power.
- When XNMI is driven active (negative edge triggered shown, as an example), the oscillator is turned on; but the PLL is not activated.
- When XNMI is deactivated, it initiates the PLL lock sequence, which takes 131,072 X1/XCLKIN cycles.
- When CLKIN to the core is enabled, the device will respond to the interrupt (if enabled), after a latency. The HALT mode is now exited.
- Normal operation resumes.

Figure 6-15. HALT Wakeup Using XNMI

## 6.17 Event Manager Interface

### 6.17.1 PWM Timing

PWM refers to all PWM outputs on EVA and EVB.

**Table 6-13. PWM Switching Characteristics†‡**

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_w(\text{PWM})\$$	Pulse duration, PWMx output high/low		25	ns
$t_d(\text{PWM})\text{XCO}$	Delay time, XCLKOUT high to PWMx output switching	XCLKOUT = SYSCLKOUT/4	10	ns

† See the GPIO output timing for fall/rise times for PWM pins.

‡ PWM pin toggling frequency is limited by the GPIO output buffer switching frequency (20 MHz).

§ PWM outputs may be 100%, 0%, or increments of  $t_c(\text{HCO})$  with respect to the PWM period.

**Table 6-14. Timer and Capture Unit Timing Requirements¶#**

		MIN	MAX	UNIT
$t_w(\text{TDIR})$	Pulse duration, TDIRx low/high	Without input qualifier	$2 * t_c(\text{SCO})$	cycles
		With input qualifier	$1 * t_c(\text{SCO}) + \text{IQT}  $	
$t_w(\text{CAP})$	Pulse duration, CAPx input low/high	Without input qualifier	$2 * t_c(\text{SCO})$	cycles
		With input qualifier	$1 * t_c(\text{SCO}) + \text{IQT}  $	
$t_w(\text{TCLKINL})$	Pulse duration, TCLKINx low as a percentage of TCLKINx cycle time	40	60	%
$t_w(\text{TCLKINH})$	Pulse duration, TCLKINx high as a percentage of TCLKINx cycle time	40	60	%
$t_c(\text{TCLKIN})$	Cycle time, TCLKINx	$4 * t_c(\text{HCO})$		ns

¶ The QUALPRD bit field value can range from 0 (no qualification) through 0xFF (510 SYSCLKOUT cycles). The qualification sampling period is  $2n$  SYSCLKOUT cycles, where “n” is the value stored in the QUALPRD bit field. As an example, when QUALPRD = 1, the qualification sampling period is  $1 \times 2 = 2$  SYSCLKOUT cycles (i.e., the input is sampled every 2 SYSCLKOUT cycles). Six such samples will be taken over five sampling windows, each window being  $2n$  SYSCLKOUT cycles. For QUALPRD = 1, the minimum width that is needed is  $5 \times 2 = 10$  SYSCLKOUT cycles. However, since the external signal is driven asynchronously, a 11-SYSCLKOUT-wide pulse ensures reliable recognition.

# Maximum input frequency to the QEP =  $\min[\text{HSPCLK}/2, 20 \text{ MHz}]$

|| Input Qualification Time (IQT) =  $[5 \times \text{QUALPRD} \times 2] * t_c(\text{SCO})$

**Figure 6-16. PWM Output Timing**

**Figure 6-17. TDIRx Timing**

**Table 6-15. External ADC Start-of-Conversion – EVA – Switching Characteristics†**

PARAMETER		MIN	MAX	UNIT
$t_d(XCOH-EVASOCL)$	Delay time, XCLKOUT high to $\overline{EVASOC}$ low		$1 * t_c(SCO)$	cycle
$t_w(EVASOCL)$	Pulse duration, $\overline{EVASOC}$ low		$32 * t_c(HCO)$	ns

† XCLKOUT = SYSCLKOUT

**Figure 6-18.  $\overline{EVASOC}$  Timing****Table 6-16. External ADC Start-of-Conversion – EVB – Switching Characteristics†**

PARAMETER		MIN	MAX	UNIT
$t_d(XCOH-EVBSOCL)$	Delay time, XCLKOUT high to $\overline{EVBSOC}$ low		$1 * t_c(SCO)$	cycle
$t_w(EVBSOCL)$	Pulse duration, $\overline{EVBSOC}$ low		$32 * t_c(HCO)$	ns

† XCLKOUT = SYSCLKOUT

**Figure 6-19.  $\overline{EVBSOC}$  Timing**

### 6.17.2 Interrupt Timing

**Table 6-17. Interrupt Switching Characteristics**

PARAMETER		MIN	MAX	UNIT
$t_d(PDP-PWM)_{HZ}$	Delay time, $\overline{PDPINTx}$ low to PWM high-impedance state	Without input qualifier	12	ns
		With input qualifier	$1 * t_c(SCO) + IQT + 12^\dagger$	
$t_d(TRIP-PWM)_{HZ}$	Delay time, $\overline{CxTRIP/TxCTRIP}$ signals low to PWM high-impedance state	Without input qualifier	$3 * t_c(SCO)$	ns
		With input qualifier	$[2 * t_c(SCO)] + IQT^\dagger$	
$t_d(INT)$	Delay time, INT low/high to interrupt-vector fetch	$t_{qual} + 12t_c(XCO)$		ns

$^\dagger$  Input Qualification Time (IQT) =  $[5 \times \text{QUALPRD} \times 2] * t_c(SCO)$

**Table 6-18. Interrupt Timing Requirements**

		MIN	MAX	UNIT
$t_w(INT)$	Pulse duration, INT input low/high	with no qualifier	$2 * t_c(SCO)$	cycles
		with qualifier	$1 * t_c(SCO) + IQT^\dagger$	
$t_w(PDP)$	Pulse duration, $\overline{PDPINTx}$ input low	with no qualifier	$2 * t_c(SCO)$	cycles
		with qualifier	$1 * t_c(SCO) + IQT^\dagger$	
$t_w(CxTRIP)$	Pulse duration, $\overline{CxTRIP}$ input low	with no qualifier	$2 * t_c(SCO)$	cycles
		with qualifier	$1 * t_c(SCO) + IQT^\dagger$	
$t_w(TxCTRIP)$	Pulse duration, $\overline{TxCTRIP}$ input low	with no qualifier	$2 * t_c(SCO)$	cycles
		with qualifier	$1 * t_c(SCO) + IQT^\dagger$	

$^\dagger$  Input Qualification Time (IQT) =  $[5 \times \text{QUALPRD} \times 2] * t_c(SCO)$

† XCLKOUT = SYSCLKOUT

‡ TxCTRIP – T1CTRIP, T2CTRIP, T3CTRIP, T4CTRIP  
 CxTRIP – C1TRIP, C2TRIP, C3TRIP, C4TRIP, C5TRIP, or C6TRIP  
 PDPINTx – PDPINTA or PDPINTB

§ PWM refers to all the PWM pins in the device (i.e., PWM<sub>n</sub> and T<sub>n</sub>PWM pins or PWM pin pair relevant to each CxTRIP pin). The state of the PWM pins after PDPINTx is taken high depends on the state of the FCOMPOE bit.

Figure 6-20. External Interrupt Timing

## 6.18 General-Purpose Input/Output (GPIO) – Output Timing

Table 6-19. General-Purpose Output Switching Characteristics

PARAMETER		MIN	MAX	UNIT
t <sub>d</sub> (XCOH-GPO)	Delay time, XCLKOUT high to GPIO low/high	All GPIOs	1 * t <sub>c</sub> (SCO)	cycle
t <sub>r</sub> (GPO)	Rise time, GPIO switching low to high	All GPIOs	10	ns
t <sub>f</sub> (GPO)	Fall time, GPIO switching high to low	All GPIOs	10	ns
f <sub>GPO</sub>	Toggling frequency, GPO pins		20	MHz

Figure 6-21. General-Purpose Output Timing

## 6.19 General-Purpose Input/Output (GPIO) – Input Timing

NOTES: A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. Input qualification is not applicable when QUALPRD = 00. For any other value "n", the qualification sampling period in  $2n$  SYSCLKOUT cycles (i.e., at every  $2n$  SYSCLKOUT cycle, the GPIO pin will be sampled). Six consecutive samples must be of the same value for a given input to be recognized.  
 B. For the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for  $(5 \times \text{QUALPRD} \times 2)$  SYSCLKOUT cycles. This would ensure six sampling windows for detection to occur. Since external signals are driven asynchronously, an 11-SYSCLKOUT-wide pulse ensures reliable recognition.

**Figure 6–22. GPIO Input Qualifier – Example Diagram for QUALPRD = 1**

**Table 6–20. General-Purpose Input Timing Requirements**

$t_w(\text{GPIO})$	Pulse duration, GPIO low/high	All GPIOs	MIN	MAX	UNIT
			With no qualifier	$2 * t_c(\text{SCO})$	cycles
		With qualifier	$1 * t_c(\text{SCO}) + \text{IQT}^\dagger$		

$\dagger$  Input Qualification Time (IQT) =  $[5 \times \text{QUALPRD} \times 2] * t_c(\text{SCO})$

**Figure 6–23. General-Purpose Input Timing**

**NOTE:** The pulse width requirement for general-purpose input is applicable for the  $\overline{\text{XBIO}}$  and  $\text{ADCSOC}$  pins as well.

## 6.20 SPI Master Mode Timing

Table 6-21. SPI Master Mode External Timing (Clock Phase = 0)<sup>†‡</sup>

NO.		SPI WHEN (SPIBRR + 1) IS EVEN OR SPIBRR = 0 OR 2				MAX	UNIT

Figure 6-27. SPI Slave Mode External Timing (Clock Phase = 1)

## 6.22 External Interface (XINTF) Timing

Each XINTF access consists of three parts: Lead, Active, and Trail. The user configures the Lead/Active/Trail wait states in the XTIMING registers. There is one XTIMING register for each XINTF zone. Table 6-25 shows the relationship between the parameters configured in the XTIMING register and the duration of the pulse in terms of XTIMCLK cycles.

**Table 6-25. Relationship Between Parameters Configured in XTIMING and Duration of Pulse†‡**

DESCRIPTION	DURATION (ns)	
	X2TIMING = 0	X2TIMING = 1
LR Lead period, read access	XRDLEAD $\times t_c(XTIM)$	$(XRDLEAD \times 2) \times t_c(XTIM)$
AR Active period, read access	$(XRDACTIVE + WS + 1) \times t_c(XTIM)$	$(XRDACTIVE \times 2 + WS + 1) \times t_c(XTIM)$
TR Trail period, read access	XRDTRAIL $\times t_c(XTIM)$	$(XRDTRAIL \times 2) \times t_c(XTIM)$
LW Lead period, write access	XWRLEAD $\times t_c(XTIM)$	$(XWRLEAD \times 2) \times t_c(XTIM)$
AW Active period, write access	$(XWRACTIVE + WS + 1) \times t_c(XTIM)$	$(XWRACTIVE \times 2 + WS + 1) \times t_c(XTIM)$
TW Trail period, write access	XWRTRAIL $\times t_c(XTIM)$	$(XWRTRAIL \times 2) \times t_c(XTIM)$

†  $t_c(XTIM)$  – Cycle time, XTIMCLK

‡ WS refers to the number of wait states inserted by hardware when using XREADY. If the zone is configured to ignore XREADY (USEREADY = 0), then WS = 0.

Minimum wait state requirements must be met when configuring each zone's XTIMING register. These requirements are in addition to any timing requirements as specified by that device's data sheet. No internal device hardware is included to detect illegal settings.

- If the XREADY signal is ignored (USEREADY = 0), then:

$$\begin{aligned} 1. \text{ Lead:} \quad & LR \geq t_c(XTIM) \\ & LW \geq t_c(XTIM) \end{aligned}$$

These requirements result in the following XTIMING register configuration restrictions§:

XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
$\geq 1$	$\geq 0$	$\geq 0$	$\geq 1$	$\geq 0$	$\geq 0$	0, 1

§ No hardware to detect illegal XTIMING configurations

Examples of valid and invalid timing when not sampling XREADY§:

	XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
Invalid	0	0	0	0	0	0	0, 1
Valid	1	0	0	1	0	0	0, 1

§ No hardware to detect illegal XTIMING configurations

- If the XREADY signal is sampled in the Synchronous mode (USEREADY = 1, READYMODE = 0), then:
  1. Lead:  $LR \geq t_c(XTIM)$   
 $LW \geq t_c(XTIM)$
  2. Active:  $AR \geq 2 \times t_c(XTIM)$   
 $AW \geq 2 \times t_c(XTIM)$

**NOTE:** Restriction does not include external hardware wait states

These requirements result in the following XTIMING register configuration restrictions<sup>†</sup>:

XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
$\geq 1$	$\geq 1$	$\geq 0$	$\geq 1$	$\geq 1$	$\geq 0$	0, 1

<sup>†</sup> No hardware to detect illegal XTIMING configurations

Examples of valid and invalid timing when using Synchronous XREADY<sup>†</sup>:

	XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
Invalid	0	0	0	0	0	0	0, 1
Invalid	1	0	0	1	0	0	0, 1
Valid	1	1	0	1	1	0	0, 1

<sup>†</sup> No hardware to detect illegal XTIMING configurations

- If the XREADY signal is sampled in the Asynchronous mode (USEREADY = 1, READYMODE = 1), then:

1. Lead:  $LR \geq t_c(XTIM)$   
 $LW \geq t_c(XTIM)$
2. Active:  $AR \geq 2 \times t_c(XTIM)$   
 $AW \geq 2 \times t_c(XTIM)$

**NOTE:** Restriction does not include external hardware wait states

3. Lead + Active:  $LR + AR \geq 4 \times t_c(XTIM)$   
 $LW + AW \geq 4 \times t_c(XTIM)$

**NOTE:** Restriction does not include external hardware wait states

These requirements result in the following XTIMING register configuration restrictions<sup>†</sup>:

XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
$\geq 1$	$\geq 2$	0	$\geq 1$	$\geq 2$	0	0, 1

<sup>†</sup> No hardware to detect illegal XTIMING configurations

or<sup>†</sup>

XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
$\geq 2$	$\geq 1$	0	$\geq 2$	$\geq 1$	0	0, 1

<sup>†</sup> No hardware to detect illegal XTIMING configurations

Examples of valid and invalid timing when using Asynchronous XREADY<sup>†</sup>:

	XRDLEAD	XRDACTIVE	XRDTRAIL	XWRLEAD	XWRACTIVE	XWRTRAIL	X2TIMING
Invalid	0	0	0	0	0	0	0, 1
Invalid	1	0	0	1	0	0	0, 1
Invalid	1	1	0	1	1	0	0
Valid	1	1	0	1	1	0	1
Valid	1	2	0	1	2	0	0, 1
Valid	2	1	0	2	1	0	0, 1

<sup>†</sup> No hardware to detect illegal XTIMING configurations

Unless otherwise specified, all XINTF timing is applicable for the clock configurations shown in Table 6-26.

**Table 6-26. XINTF Clock Configurations**

Mode	SYCLKOUT	XTIMCLK	XCLKOUT
1 Example:	150 MHz	SYCLKOUT 150 MHz	SYCLKOUT 150 MHz
2 Example:	150 MHz	SYCLKOUT 150 MHz	1/2 SYCLKOUT 75 MHz
3 Example:	150 MHz	1/2 SYCLKOUT 75 MHz	1/2 SYCLKOUT 75 MHz
4 Example:	150 MHz	1/2 SYCLKOUT 75 MHz	1/4 SYCLKOUT 37.5 MHz

The relationship between SYCLKOUT and XTIMCLK is shown in Figure 6-28.

† Default Value after reset

**Figure 6-28. Relationship Between XTIMCLK and SYCLKOUT**

### 6.23 XINTF Signal Alignment to XCLKOUT

For each XINTF access, the number of lead, active, and trail cycles is based on the internal clock XTIMCLK. Strobes such as  $\overline{XRD}$ ,  $\overline{XWE}$ , and zone chip-select (XZCS) change state in relationship to the rising edge of XTIMCLK. The external clock, XCLKOUT, can be configured to be either equal to or one-half the frequency of XTIMCLK.

For the case where  $XCLKOUT = XTIMCLK$ , all of the XINTF strobes will change state with respect to the rising edge of XCLKOUT. For the case where  $XCLKOUT = \text{one-half } XTIMCLK$ , some strobes will change state either on the rising edge of XCLKOUT or the falling edge of XCLKOUT. In the XINTF timing tables, the notation XCOHL is used to indicate that the parameter is with respect to either case; XCLKOUT rising edge (high) or XCLKOUT falling edge (low). If the parameter is always with respect to the rising edge of XCLKOUT, the notation XCOH is used.

For the case where XCLKOUT = one-half XTIMCLK, the XCLKOUT edge with which the change will be aligned can be determined based on the number of XTIMCLK cycles from the start of the access to the point at which the signal changes. If this number of XTIMCLK cycles is even, the alignment will be with respect to the rising edge of XCLKOUT. If this number is odd, then the signal will change with respect to the falling edge of XCLKOUT. Examples include the following:

- Strobes that change at the beginning of an access always align to the rising edge of XCLKOUT. This is because all XINTF accesses begin with respect to the rising edge of XCLKOUT.

Examples:	XZCSL	Zone chip-select active low
	XRNWL	XR/W active low

- Strobes that change at the beginning of the active period will align to the rising edge of XCLKOUT if the total number of lead XTIMCLK cycles for the access is even. If the number of lead XTIMCLK cycles is odd, then the alignment will be with respect to the falling edge of XCLKOUT.

Examples:	XRDL	XRD active low
	XWEL	XWE active low

- Strobes that change at the beginning of the trail period will align to the rising edge of XCLKOUT if the total number of lead + active XTIMCLK cycles (including hardware waitstates) for the access is even. If the number of lead + active XTIMCLK cycles (including hardware waitstates) is odd, then the alignment will be with respect to the falling edge of XCLKOUT.

Examples:	XRDH	XRD inactive high
	XWEH	XWE inactive high

- Strobes that change at the end of the access will align to the rising edge of XCLKOUT if the total number of lead + active + trail XTIMCLK cycles (including hardware waitstates) is even. If the number of lead + active + trail XTIMCLK cycles (including hardware waitstates) is odd, then the alignment will be with respect to the falling edge of XCLKOUT.

Examples:	XZCSH	Zone chip-select inactive high
	XRNWH	XR/W inactive high

## 6.24 External Interface Read Timing

Table 6-27. External Memory Interface Read Switching Characteristics

PARAMETER	MIN	MAX	UNIT	
$t_d(XCOH-XZCSL)$	Delay time, XCLKOUT high to zone chip-select active low	1	ns	
$t_d(XCOHL-XZCSH)$	Delay time, XCLKOUT high/low to zone chip-select inactive high	-2	3	ns
$t_d(XCOH-XA)$	Delay time, XCLKOUT high to address valid	2	ns	
$t_d(XCOHL-XRDL)$	Delay time, XCLKOUT high/low to XRD active low	1	ns	
$t_d(XCOHL-XRDH)$	Delay time, XCLKOUT high/low to XRD inactive high	-2	1	ns
$t_h(XA)XZCSH$	Hold time, address valid after zone chip-select inactive high	†	ns	
$t_h(XA)XRD$	Hold time, address valid after XRD inactive high	†	ns	

† During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.

Table 6-28. External Memory Interface Read Timing Requirements

	MIN	MAX	UNIT
$t_a(A)$	Access time, read data from address valid	$(LR + AR) - 14\ddagger$	ns
$t_a(XRD)$	Access time, read data valid from XRD active low	$AR - 12\ddagger$	ns
$t_{su}(XD)XRD$	Setup time, read data valid before XRD strobe inactive high	12	ns
$t_h(XD)XRD$	Hold time, read data valid after XRD inactive high	0	ns

† LR = Lead period, read access. AR = Active period, read access. See Table 6-25.

NOTES: A. All XINTF accesses (lead period) begin on the rising edge of XCLKOUT. When necessary, the device will insert an alignment cycle before an access to meet this requirement.  
 B. During alignment cycles, all signals will transition to their inactive state.  
 C. For USEREADY = 0, the external XREADY input signal is ignored.  
 D. XA[0:18] will hold the last address put on the bus during inactive cycles, including alignment cycles.

Figure 6-29. Example Read Access

## 6.25 External Interface Write Timing

Table 6-29. External Memory Interface Write Switching Characteristics

PARAMETER	MIN	MAX	UNIT
$t_d(XCOH-XZCSL)$	Delay time, XCLKOUT high to zone chip-select active low	1	ns
$t_d(XCOHL-XZCSH)$	Delay time, XCLKOUT high or low to zone chip-select inactive high	-2	3
$t_d(XCOH-XA)$	Delay time, XCLKOUT high to address valid	2	ns
$t_d(XCOHL-XWEL)$	Delay time, XCLKOUT high/low to $\overline{XWE}$ low	2	ns
$t_d(XCOHL-XWEH)$	Delay time, XCLKOUT high/low to $\overline{XWE}$ high	2	ns
$t_d(XCOH-XRNWL)$	Delay time, XCLKOUT high to $\overline{XR/W}$ low	1	ns
$t_d(XCOHL-XRNWH)$	Delay time, XCLKOUT high/low to $\overline{XR/W}$ high	-2	1
$t_{en}(XD)XWEL$	Enable time, data bus driven from $\overline{XWE}$ low	0	ns
$t_d(XWEL-XD)$	Delay time, data valid after $\overline{XWE}$ active low	4	ns
$t_h(XA)XZCSH$	Hold time, address valid after zone chip-select inactive high	†	ns
$t_h(XD)XWE$	Hold time, write data valid after $\overline{XWE}$ inactive high	$TW-2\ddagger$	ns
$t_{dis}(XD)XRNW$	Data bus disabled after $\overline{XR/W}$ inactive high	4	ns

† During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.

‡ TW = Trail period, write access. See Table 6-25.

NOTES:

- All XINTF accesses (lead period) begin on the rising edge of XCLKOUT. When necessary, the device will insert an alignment cycle before an access to meet this requirement.
- During alignment cycles, all signals will transition to their inactive state.
- For USEREADY = 0, the external XREADY input signal is ignored.
- XA[0:18] will hold the last address put on the bus during inactive cycles, including alignment cycles.

## 6.26 External Interface Ready-on-Read Timing With One External Wait State

**Table 6–30. External Memory Interface Read Switching Characteristics (Ready-on-Read, 1 Wait State)**

PARAMETER		MIN	MAX	UNIT
$t_d(XCOH-XZCSL)$	Delay time, XCLKOUT high to zone chip-select active low		1	ns
$t_d(XCOHL-XZCSH)$	Delay time, XCLKOUT high/low to zone chip-select inactive high	-2	3	ns
$t_d(XCOH-XA)$	Delay time, XCLKOUT high to address valid		2	ns
$t_d(XCOHL-XRDL)$	Delay time, XCLKOUT high/low to $\overline{XRD}$ active low		1	ns
$t_d(XCOHL-XRDH)$	Delay time, XCLKOUT high/low to $\overline{XRD}$ inactive high	-2	1	ns
$t_h(XA)XZCSH$	Hold time, address valid after zone chip-select inactive high	†		ns
$t_h(XA)XRD$	Hold time, address valid after $\overline{XRD}$ inactive high	†		ns

† During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.

**Table 6–31. External Memory Interface Read Timing Requirements (Ready-on-Read, 1 Wait State)**

		MIN	MAX	UNIT
$t_a(A)$	Access time, read data from address valid		$(LR + AR) - 14\ddagger$	ns
$t_a(XRD)$	Access time, read data valid from $\overline{XRD}$ active low		$AR - 12\ddagger$	ns
$t_{su}(XD)XRD$	Setup time, read data valid before $\overline{XRD}$ strobe inactive high	12		ns
$t_h(XD)XRD$	Hold time, read data valid after $\overline{XRD}$ inactive high	0		ns

† LR = Lead period, read access. AR = Active period, read access. See Table 6–25.

**Table 6–32. Synchronous XREADY Timing Requirements (Ready-on-Read, 1 Wait State) $\S$**

		MIN	MAX	UNIT
$t_{su}(XRDYsynchL)XCOHL$	Setup time, XREADY (Synch) low before XCLKOUT high/low	15		ns
$t_h(XRDYsynchL)$	Hold time, XREADY (Synch) low	12		ns
$t_e(XRDYsynchH)$	Earliest time XREADY (Synch) can go high before the sampling XCLKOUT edge		3	ns
$t_{su}(XRDYsynchH)XCOHL$	Setup time, XREADY (Synch) high before XCLKOUT high/low	15		ns
$t_h(XRDYsynchH)XZCSH$	Hold time, XREADY (Synch) held high after zone chip select high	0		ns

$\S$  The first XREADY (Synch) sample occurs with respect to E in Figure 6–31:

$$E = (XRDLEAD + XRDACTIVE) t_c(XTIM)$$

When first sampled, if XREADY (Synch) is found to be high, then the access will complete. If XREADY (Synch) is found to be low, it will be sampled again each  $t_c(XTIM)$  until it is found to be high.

For each sample (n) the setup time (D) with respect to the beginning of the access can be calculated as:

$$D = (XRDLEAD + XRDACTIVE + n - 1) t_c(XTIM) - t_{su}(XRDYsynchL)XCOHL$$

where n is the sample number: n = 1, 2, 3, and so forth.

**Table 6–33. Asynchronous XREADY Timing Requirements (Ready-on-Read, 1 Wait State) $\mathfrak{T}$**

		MIN	MAX	UNIT
$t_{su}(XRDYAsynchL)XCOHL$	Setup time, XREADY (Asynch) low before XCLKOUT high/low	11		ns
$t_h(XRDYAsynchL)$	Hold time, XREADY (Asynch) low	8		ns
$t_e(XRDYAsynchH)$	Earliest time XREADY (Asynch) can go high before the sampling XCLKOUT edge		3	ns
$t_{su}(XRDYAsynchH)XCOHL$	Setup time, XREADY (Asynch) high before XCLKOUT high/low	11		ns
$t_h(XRDYAsynchH)XZCSH$	Hold time, XREADY (Asynch) held high after zone chip select high	0		ns

$\mathfrak{T}$  The first XREADY (Asynch) sample occurs with respect to E in Figure 6–32:

$$E = (XRDLEAD + XRDACTIVE - 2) t_c(XTIM)$$

When first sampled, if XREADY (Asynch) is found to be high, then the access will complete. If XREADY (Asynch) is found to be low, it will be sampled again each  $t_c(XTIM)$  until it is found to be high.

For each sample, setup time from the beginning of the access can be calculated as:

$$D = (XRDLEAD + XRDACTIVE - 3 + n) t_c(XTIM) - t_{su}(XRDYAsynchL)XCOHL$$

where n is the sample number: n = 1, 2, 3, and so forth.

**Legend:**

= Don't care. Signal can be high or low during this time.

NOTES:

- All XINTF accesses (lead period) begin on the rising edge of XCLKOUT. When necessary, the device will insert an alignment cycle before an access to meet this requirement.
- During alignment cycles, all signals will transition to their inactive state.
- During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.
- For each sample, setup time from the beginning of the access (D) can be calculated as:  

$$D = (XRDLEAD + XRDACTIVE + n - 1) t_c(XTIM) - t_{su}(XRDYsynchL)XCOHL$$
- Reference for the first sample is with respect to this point  

$$E = (XRDLEAD + XRDACTIVE) t_c(XTIM)$$

where n is the sample number: n = 1, 2, 3, and so forth.

**Figure 6–31. Example Read With Synchronous XREADY Access**

XTIMING register parameters used for this example:

XRDLEAD	XRDACTIVE	XRDTRAIL	USEREADY	X2TIMING	XWRLEAD	XWRACTIVE	XWRTRAIL	READYMODE
≥1	3	≥1	1	0	N/A <sup>†</sup>	N/A <sup>†</sup>	N/A <sup>†</sup>	0 = XREADY (Synch)

<sup>†</sup> N/A = "Don't care" for this example

**Legend:**

 = Don't care. Signal can be high or low during this time.

NOTES:

- All XINTF accesses (lead period) begin on the rising edge of XCLKOUT. When necessary, the device will insert an alignment cycle before an access to meet this requirement.
- During alignment cycles, all signals will transition to their inactive state.
- During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.
- For each sample, setup time from the beginning of the access can be calculated as:  

$$D = (XRDLEAD + XRDACTIVE -3 +n) t_c(XTIM) - t_{su}(XRDYasynchL)XCOHL$$
where n is the sample number: n = 1, 2, 3, and so forth.
- Reference for the first sample is with respect to this point:  

$$E = (XRDLEAD + XRDACTIVE -2) t_c(XTIM)$$

**Figure 6–32. Example Read With Asynchronous XREADY Access**

## 6.27 External Interface Ready-on-Write Timing With One External Wait State

**Table 6–34. External Memory Interface Write Switching Characteristics (Ready-on-Write, 1 Wait State)**

PARAMETER	MIN	MAX	UNIT
$t_d(XCOH-XZCSL)$	Delay time, XCLKOUT high to zone chip-select active low	1	ns
$t_d(XCOHL-XZCSH)$	Delay time, XCLKOUT high or low to zone chip-select inactive high	-2	3
$t_d(XCOH-XA)$	Delay time, XCLKOUT high to address valid	2	ns
$t_d(XCOHL-XWEL)$	Delay time, XCLKOUT high/low to $\overline{XWE}$ low	2	ns
$t_d(XCOHL-XWEH)$	Delay time, XCLKOUT high/low to $\overline{XWE}$ high	2	ns
$t_d(XCOH-XRNWL)$	Delay time, XCLKOUT high to $XR/W$ low	1	ns
$t_d(XCOHL-XRNWH)$	Delay time, XCLKOUT high/low to $XR/W$ high	-2	1
$t_{en}(XD)XWEL$	Enable time, data bus driven from $\overline{XWE}$ low	0	ns
$t_d(XWEL-XD)$	Delay time, data valid after $XWE$ active low		4
$t_h(XA)XZCSH$	Hold time, address valid after zone chip-select inactive high	†	ns
$t_h(XD)XWE$	Hold time, write data valid after $\overline{XWE}$ inactive high	TW-2‡	ns
$t_{dis}(XD)XRNW$	Data bus disabled after $XR/W$ inactive high	4	ns

† During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.

‡ TW = trail period, write access (see Table 6–25)

**Table 6–35. Synchronous XREADY Timing Requirements (Ready-on-Write, 1 Wait State)§**

	MIN	MAX	UNIT
$t_{su}(XRDYsynchL)XCOHL$	Setup time, XREADY (Synch) low before XCLKOUT high/low	15	ns
$t_h(XRDYsynchL)$	Hold time, XREADY (Synch) low	12	ns
$t_e(XRDYsynchH)$	Earliest time XREADY (Synch) can go high before the sampling XCLKOUT edge	3	ns
$t_{su}(XRDYsynchH)XCOHL$	Setup time, XREADY (Synch) high before XCLKOUT high/low	15	ns
$t_h(XRDYsynchH)XZCSH$	Hold time, XREADY (Synch) held high after zone chip select high	0	ns

§ The first XREADY (Synch) sample occurs with respect to E in Figure 6–33:

$$E = (XWRLEAD + XWRACTIVE) t_c(XTIM)$$

When first sampled, if XREADY (Synch) is found to be high, then the access will complete. If XREADY (Synch) is found to be low, it will be sampled again each  $t_c(XTIM)$  until it is found to be high.

For each sample, setup time from the beginning of the access can be calculated as:

$$D = (XWRLEAD + XWRACTIVE + n - 1) t_c(XTIM) - t_{su}(XRDYsynchL)XCOHL$$

where n is the sample number: n = 1, 2, 3, and so forth.

**Table 6–36. Asynchronous XREADY Timing Requirements (Ready-on-Write, 1 Wait State)¶**

	MIN	MAX	UNIT
$t_{su}(XRDYasynchL)XCOHL$	Setup time, XREADY (Asynch) low before XCLKOUT high/low	11	ns
$t_h(XRDYasynchL)$	Hold time, XREADY (Asynch) low	8	ns
$t_e(XRDYasynchH)$	Earliest time XREADY (Asynch) can go high before the sampling XCLKOUT edge	3	ns
$t_{su}(XRDYasynchH)XCOHL$	Setup time, XREADY (Asynch) high before XCLKOUT high/low	11	ns
$t_h(XRDYasynchH)XZCSH$	Hold time, XREADY (Asynch) held high after zone chip select high	0	ns

¶ The first XREADY (Synch) sample occurs with respect to E in Figure 6–34:

$$E = (XWRLEAD + XWRACTIVE - 2) t_c(XTIM)$$

When first sampled, if XREADY (Asynch) is found to be high, then the access will complete. If XREADY (Asynch) is found to be low, it will be sampled again each  $t_c(XTIM)$  until it is found to be high.

For each sample, setup time from the beginning of the access can be calculated as:

$$D = (XWRLEAD + XWRACTIVE - 3 + n) t_c(XTIM) - t_{su}(XRDYasynchL)XCOHL$$

where n is the sample number: n = 1, 2, 3, and so forth.

## Legend:

= Don't care. Signal can be high or low during this time.

NOTES:

- All XINTF accesses (lead period) begin on the rising edge of XCLKOUT. When necessary, the device will insert an alignment cycle before an access to meet this requirement.
- During alignment cycles, all signals will transition to their inactive state.
- During inactive cycles, the XINTF address bus will always hold the last address put out on the bus. This includes alignment cycles.
- For each sample, setup time from the beginning of the access can be calculated as  

$$D = (XWRLEAD + XWRACTIVE + n - 1) t_c(XTIM) - t_{su}(XRDYsynchL)XCOHL$$
where n is the sample number: n = 1, 2, 3 and so forth.
- Reference for the first sample is with respect to this point  

$$E = (XWRLEAD + XWRACTIVE) t_c(XTIM)$$

Figure 6–33. Write With Synchronous XREADY Access

N/A <sup>†</sup>	N/A <sup>†</sup>	N/A <sup>†</sup>	1	0	$\geq 1$	3	$\geq 1$	1 = XREADY (Asynch)

<sup>†</sup> N/A = "Don't care" for this example

## 6.28 XHOLD and XHOLDA

If the HOLD mode bit is set while XHOLD and XHOLDA are both low (external bus accesses granted), the XHOLDA signal is forced high (at the end of the current cycle) and the external interface is taken out of high-impedance mode.

On a reset (XRS), the HOLD mode bit is set to 0. If the XHOLD signal is active low on a system reset, the bus and all signal strobes must be in high-impedance mode, and the XHOLDA signal is also driven active low.

When HOLD mode is enabled and XHOLDA is active low (external bus grant active), the CPU can still execute code from internal memory. If an access is made to the external interface, the CPU is stalled until the XHOLD signal is removed.

An external DMA request, when granted, places the following signals in a high-impedance mode:

XA[18:0]	<u>XZCS0AND1</u>
XD[15:0]	<u>XZCS2</u>
<u>XWE</u> , <u>XRD</u>	<u>XZCS6AND7</u>
XR/W	

All other signals not listed in this group remain in their default or functional operational modes during these signal events. Detailed timing diagram will be released in a future revision of this data sheet.

## 6.29 XHOLD/XHOLDA Timing

Table 6-37. XHOLD/XHOLDA Timing Requirements (XCLKOUT = XTIMCLK)<sup>†‡</sup>

		MIN	MAX	UNIT
$t_{d(HL-HiZ)}$	Delay time, XHOLD low to Hi-Z on all Address, Data, and Control	$4t_c(XTIM)$		ns
$t_{d(HL-HAL)}$	Delay time, XHOLD low to XHOLDA low	$5t_c(XTIM)$		ns
$t_{d(HH-HAH)}$	Delay time, XHOLD high to XHOLDA high	$3t_c(XTIM)$		ns
$t_{d(HH-BV)}$	Delay time, XHOLD high to Bus valid	$4t_c(XTIM)$		ns

<sup>†</sup> When a low signal is detected on XHOLD, all pending XINTF accesses will be completed before the bus is placed in a high-impedance state.  
<sup>‡</sup> The state of XHOLD is latched on the rising edge of XTIMCLK.

NOTES: A. All pending XINTF accesses are completed.  
B. Normal XINTF operation resumes.

Figure 6-35. External Interface Hold Waveform

Table 6-38. XHOLD/XHOLDA Timing Requirements (XCLKOUT = 1/2 XTIMCLK)<sup>†‡§</sup>

		MIN	MAX	UNIT
$t_{d(HL-HiZ)}$	Delay time, <u>XHOLD</u> low to Hi-Z on all Address, Data, and Control		$4t_c(XTIM)+t_c(XCO)$	ns
$t_{d(HL-HAL)}$	Delay time, <u>XHOLD</u> low to <u>XHOLDA</u> low		$4t_c(XTIM)+2t_c(XCO)$	ns
$t_{d(HH-HAH)}$	Delay time, <u>XHOLD</u> high to <u>XHOLDA</u> high		$4t_c(XTIM)$	ns
$t_{d(HH-BV)}$	Delay time, <u>XHOLD</u> high to Bus valid		$6t_c(XTIM)$	ns

<sup>†</sup> When a low signal is detected on XHOLD, all pending XINTF accesses will be completed before the bus is placed in a high-impedance state.

<sup>‡</sup> The state of XHOLD is latched on the rising edge of XTIMCLK.

<sup>§</sup> After the XHOLD is detected low or high, all bus transitions and XHOLDA transitions will occur with respect to the rising edge of XCLKOUT. Thus, for this mode where XCLKOUT = 1/2 XTIMCLK, the transitions can occur up to 1 XTIMCLK cycle earlier than the maximum value specified.

NOTES: A All pending XINTF accesses are completed.

B Normal XINTF operation resumes.

Figure 6-36. XHOLD/XHOLDA Timing Requirements (XCLKOUT = 1/2 XTIMCLK)

## 6.30 On-Chip Analog-to-Digital Converter

### 6.30.1 ADC Absolute Maximum Ratings<sup>†</sup>

Supply voltage range, $V_{SSA1}/V_{SSA2}$ to $V_{DDA1}/V_{DDA2}/AV_{DDREFBG}$ .....	-0.3 V to 4.6 V
$V_{SS1}$ to $V_{DD1}$ .....	-0.3 V to 2.5 V
Analog Input (ADCIN) Clamp Current, total (max) .....	$\pm 20$ mA <sup>‡</sup>

<sup>†</sup> Unless otherwise noted, the list of absolute maximum ratings are specified over operating conditions. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

<sup>‡</sup> The analog inputs have an internal clamping circuit that clamps the voltage to a diode drop above  $V_{DDA}$  or below  $V_{SS}$ . The continuous clamp current per pin is  $\pm 2$  mA.

### 6.30.2 ADC Electrical Characteristics Over Recommended Operating Conditions

Table 6-39. DC Specifications (See Note 1)

PARAMETER		MIN	TYP	MAX	UNIT
Resolution		12			Bits
ADC clock (See Note 2)		1			kHz
<b>ACCURACY</b>					
INL (Integral nonlinearity) (See Note 3)	1–18.75 MHz ADC clock		±1.5		LSB
DNL (Differential nonlinearity) (See Note 3)	1–18.75 MHz ADC clock		±1		LSB
Offset error (See Note 4)		–80	80		LSB
Overall gain error with internal reference (See Note 5)		–200	200		LSB
Overall gain error with external reference (See Note 6)	If $\text{ADCREFP} - \text{ADCREFM} = 1 \text{ V} \pm 0.1\%$	–50	50		LSB
Channel-to-channel offset variation			±8		LSB
Channel-to-channel Gain variation			±8		LSB
<b>ANALOG INPUT</b>					
Analog input voltage (ADCINx to ADCLO) (See Note 7)		0	3		V
ADCLO		–5	0	5	mV
Input capacitance			10		pF
Input leakage current		3	±5		µA
<b>INTERNAL VOLTAGE REFERENCE (See Note 5)</b>					
Accuracy, $\text{ADCV}_{\text{REFP}}$		1.9	2	2.1	V
Accuracy, $\text{ADCV}_{\text{REFM}}$		0.95	1	1.05	V
Voltage difference, $\text{ADCREFP} - \text{ADCREFM}$			1		V
Temperature coefficient			50		PPM/°C
Reference noise			100		µV
<b>EXTERNAL VOLTAGE REFERENCE (See Note 6)</b>					
Accuracy, $\text{ADCV}_{\text{REFP}}$		1.9	2	2.1	V
Accuracy, $\text{ADCV}_{\text{REFM}}$		0.95	1	1.05	V
Input voltage difference, $\text{ADCREFP} - \text{ADCREFM}$		0.99	1	1.01	V

NOTES: 1. Tested at 12.5-MHz ADCCLK

2. If  $\text{SYSCLKOUT} \leq 25 \text{ MHz}$ , ADC clock  $\leq \text{SYSCLKOUT}/2$ 

3. The INL degrades for frequencies beyond 18.75 MHz – 25 MHz. Applications that require these sampling rates should use a 20K-resistor as bias resistor on the ADCRESEXT pin. This improves overall linearity and typical current drawn by the ADC will be a few mA more than 24.9 kΩ bias.

4. 1 LSB has the weighted value of  $3.0/4096 = 0.732 \text{ mV}$ .5. A single internal band gap reference ( $\pm 5\%$  accuracy) sources both ADCREFP and ADCREFM signals, and hence, these voltages track together. The ADC converter uses the difference between these two as its reference. The total gain error will be the combination of the gain error shown here and the voltage reference accuracy ( $\text{ADCREFP} - \text{ADCREFM}$ ). A software-based calibration procedure is recommended for better accuracy. See *F2812 ADC Calibration Application Note* (literature number SPRA989) and Section 5.2, Documentation Support, for relevant documents.6. In this mode, the accuracy of external reference is critical for overall gain. The voltage difference ( $\text{ADCREFP} - \text{ADCREFM}$ ) will determine the overall accuracy.7. Voltages above  $\text{V}_{\text{DDA}} + 0.3 \text{ V}$  or below  $\text{V}_{\text{SS}} - 0.3 \text{ V}$  applied to an analog input pin may temporarily affect the conversion of another pin. To avoid this, the analog inputs should be kept within these limits.

Table 6-40. AC Specifications

PARAMETER		MIN	TYP	MAX	UNIT
SINAD	Signal-to-noise ratio + distortion		62		dB
SNR	Signal-to-noise ratio		62		dB
THD (100 kHz)	Total harmonic distortion		-68		dB
ENOB (SNR)	Effective number of bits		10.1		Bits
SFDR	Spurious free dynamic range		69		dB

### 6.30.3 Current Consumption for Different ADC Configurations (at 25-MHz ADCCLK)‡

I <sub>DDA</sub> (TYP) <sup>§</sup>	I <sub>DDAO</sub> (TYP)	I <sub>DD1</sub> (TYP)	ADC OPERATING MODE/CONDITIONS
40 mA	1 $\mu$ A	0.5 mA	Mode A (Operational Mode): – BG and REF enabled – PWD disabled
7 mA	0	5 $\mu$ A	Mode B: – ADC clock enabled – BG and REF enabled – PWD enabled
1 $\mu$ A	0	5 $\mu$ A	Mode C: – ADC clock enabled – BG and REF disabled – PWD enabled
1 $\mu$ A	0	0	Mode D: – ADC clock disabled – BG and REF disabled – PWD enabled

‡ Test Conditions: SYSCLKOUT = 150 MHz

ADC module clock = 25 MHz

ADC performing a continuous conversion of all 16 channels in Mode A

§ I<sub>DDA</sub> – includes current into V<sub>DDA1</sub>/V<sub>DDA2</sub> and A<sub>V</sub>DDREFBG

Typical Values of the Input Circuit Components:

Switch Resistance ( $R_{on}$ ): 1 kΩ  
 Sampling Capacitor ( $C_h$ ): 1.25 pF  
 Parasitic Capacitance ( $C_p$ ): 10 pF  
 Source Resistance ( $R_s$ ): 50 Ω

Figure 6-37. ADC Analog Input Impedance Model

#### 6.30.4 ADC Power-Up Control Bit Timing

Figure 6-38. ADC Power-Up Control Bit Timing

Table 6-41. ADC Power-Up Delays<sup>†</sup>

		MIN	TYP	MAX	UNIT
$t_d(BGR)$	Delay time for band gap reference to be stable. Bits 6 and 5 of the ADCTRL3 register (PWDNBG and PWDNREF) are to be set to 1 before the PWDNADC bit is enabled.	7	8	10	ms
$t_d(PWD)$	Delay time for power-down control to be stable. Bit 7 of the ADCTRL3 register (PWDNADC) is to be set to 1 before any ADC conversions are initiated.	20	50		μs
				1	ms

<sup>†</sup> These delays are necessary and recommended to make the ADC analog reference circuit stable before conversions are initiated. If conversions are started without these delays, the ADC results will show a higher gain. For power down, all three bits can be cleared at the same time.

### 6.30.5 Detailed Description

#### 6.30.5.1 Reference Voltage

The on-chip ADC has a built-in reference, which provides the reference voltages for the ADC. ADCVREFP is set to 2.0 V and ADCVREFM is set to 1.0 V.

#### 6.30.5.2 Analog Inputs

The on-chip ADC consists of 16 analog inputs, which are sampled either one at a time or two channels at a time. These inputs are software-selectable.

#### 6.30.5.3 Converter

The on-chip ADC uses a 12-bit four-stage pipeline architecture, which achieves a high sample rate with low power consumption.

#### 6.30.5.4 Conversion Modes

The conversion can be performed in two different conversion modes:

- Sequential sampling mode (SMODE = 0)
- Simultaneous sampling mode (SMODE = 1)

#### 6.30.6 Sequential Sampling Mode (Single-Channel) (SMODE = 0)

In sequential sampling mode, the ADC can continuously convert input signals on any of the channels (Ax to Bx). The ADC can start conversions on event triggers from the Event Managers (EVA/EVB), software trigger, or from an external ADCSOC signal. If the SMODE bit is 0, the ADC will do conversions on the selected channel on every Sample/Hold pulse. The conversion time and latency of the Result register update are explained below. The ADC interrupt flags are set a few SYSCLKOUT cycles after the Result register update. The selected channels will be sampled at every falling edge of the Sample/Hold pulse. The Sample/Hold pulse width can be programmed to be 1 ADC clock wide (minimum) or 16 ADC clocks wide (maximum).

Figure 6–39. Sequential Sampling Mode (Single-Channel) Timing

Table 6–42. Sequential Sampling Mode Timing

	SAMPLE n	SAMPLE n + 1	AT 25-MHz ADC CLOCK, $t_c(ADCCLK) = 40$ ns	REMARKS
$t_d(SH)$	Delay time from event trigger to sampling	$2.5t_c(ADCCLK)$		
$t_{SH}$	Sample/Hold width/Acquisition width	$(1 + Acqps) * t_c(ADCCLK)$	40 ns with Acqps = 0	Acqps value = 0–15 ADCTRL1[8:11]
$t_d(schx_n)$	Delay time for first result to appear in the Result register	$4t_c(ADCCLK)$	160 ns	
$t_d(schx_{n+1})$	Delay time for successive results to appear in the Result register		$(2 + Acqps) * t_c(ADCCLK)$	80 ns

### 6.30.7 Simultaneous Sampling Mode (Dual-Channel) (SMODE = 1)

In simultaneous mode, the ADC can continuously convert input signals on any one pair of channels (A0/B0 to A7/B7). The ADC can start conversions on event triggers from the Event Managers (EVA/EVB), software trigger, or from an external ADCSOC signal. If the SMODE bit is 1, the ADC will do conversions on two selected channels on every Sample/Hold pulse. The conversion time and latency of the Result register update are explained below. The ADC interrupt flags are set a few SYSCLKOUT cycles after the Result register update. The selected channels will be sampled simultaneously at the falling edge of the Sample/Hold pulse. The Sample/Hold pulse width can be programmed to be 1 ADC clock wide (minimum) or 16 ADC clocks wide (maximum).

**NOTE:** In Simultaneous mode, the ADCIN channel pair select has to be A0/B0, A1/B1, ..., A7/B7, and *not* in other combinations (such as A1/B3, etc.).

Figure 6-40. Simultaneous Sampling Mode Timing

Table 6-43. Simultaneous Sampling Mode Timing

	SAMPLE n	SAMPLE n + 1	AT 25-MHz ADC CLOCK, $t_c(ADCCLK) = 40$ ns	REMARKS
$t_d(SH)$	Delay time from event trigger to sampling	$2.5t_c(ADCCLK)$		
$t_{SH}$	Sample/Hold width/Acquisition Width	$(1 + Acqps) * t_c(ADCCLK)$	40 ns with Acqps = 0	Acqps value = 0–15 ADCTRL1[8:11]
$t_d(schA0_n)$	Delay time for first result to appear in Result register	$4t_c(ADCCLK)$	160 ns	
$t_d(schB0_n)$	Delay time for first result to appear in Result register	$5t_c(ADCCLK)$	200 ns	
$t_d(schA0_n+1)$	Delay time for successive results to appear in Result register		$(3 + Acqps) * t_c(ADCCLK)$	120 ns
$t_d(schB0_n+1)$	Delay time for successive results to appear in Result register		$(3 + Acqps) * t_c(ADCCLK)$	120 ns

### 6.30.8 Definitions of Specifications and Terminology

#### Integral Nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs 1/2 LSB before the first code transition. The full-scale point is defined as level 1/2 LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

#### Differential Nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than  $\pm 1$  LSB ensures no missing codes.

#### Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

#### Gain Error

The first code transition should occur at an analog value 1/2 LSB above negative full scale. The last transition should occur at an analog value 1 1/2 LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

#### Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

#### Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula,

$$N = \frac{(\text{SINAD} - 1.76)}{6.02}$$

it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

#### Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first six harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

#### Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

## 6.31 Multichannel Buffered Serial Port ( McBSP ) Timing

### 6.31.1 McBSP Transmit and Receive Timing

Table 6-44. McBSP Timing Requirements<sup>††</sup>

NO.				MIN	MAX	UNIT
	McBSP module clock (CLKG, CLKX, CLKR) range			1	kHz	
				20 <sup>§</sup>		MHz
	McBSP module cycle time (CLKG, CLKX, CLKR) range			50	ns	
				1		ms
M11	$t_c(\text{CKRX})$	Cycle time, CLKR/X	CLKR/X ext	2P	ns	
M12	$t_w(\text{CKRX})$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	P-7		
M13	$t_r(\text{CKRX})$	Rise time, CLKR/X	CLKR/X ext	7	ns	
M14	$t_f(\text{CKRX})$	Fall time, CLKR/X	CLKR/X ext	7		
M15	$t_{su}(\text{FRH-CKRL})$	Setup time, external FSR high before CLKR low	CLKR int	18	ns	
			CLKR ext	2		
M16	$t_h(\text{CKRL-FRH})$	Hold time, external FSR high after CLKR low	CLKR int	0	ns	
			CLKR ext	6		
M17	$t_{su}(\text{DRV-CKRL})$	Setup time, DR valid before CLKR low	CLKR int	18	ns	
			CLKR ext	2		
M18	$t_h(\text{CKRL-DRV})$	Hold time, DR valid after CLKR low	CLKR int	0	ns	
			CLKR ext	6		
M19	$t_{su}(\text{FXH-CKXL})$	Setup time, external FSX high before CLKX low	CLKX int	18	ns	
			CLKX ext	2		
M20	$t_h(\text{CKXL-FXH})$	Hold time, external FSX high after CLKX low	CLKX int	0	ns	
			CLKX ext	6		

<sup>†</sup> Polarity bits CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup>  $2P = 1/\text{CLKG}$  in ns. CLKG is the output of sample rate generator mux.  $\text{CLKG} = \frac{\text{CLKSRG}}{(1 + \text{CLKGDV})}$ .

CLKSRG can be LSPCLK, CLKX, CLKR as source. CLKSRG  $\leq (\text{SYSCLKOUT}/2)$ . McBSP performance is limited by I/O buffer switching speed.

<sup>§</sup> Internal clock prescalers must be adjusted such that the McBSP clock (CLKG, CLKX, CLKR) speeds are not greater than the I/O buffer speed limit (20 MHz).

Table 6-45. McBSP Switching Characteristics<sup>††</sup>

NO.	PARAMETER		MIN	MAX	UNIT
M1	$t_c(CKRX)$	Cycle time, CLKR/X	CLKR/X int	2P	ns
M2	$t_w(CKRXH)$	Pulse duration, CLKR/X high	CLKR/X int	D-5 <sup>§</sup>	D+5 <sup>§</sup>
M3	$t_w(CKRXL)$	Pulse duration, CLKR/X low	CLKR/X int	C-5 <sup>§</sup>	C+5 <sup>§</sup>
M4	$t_d(CKRH-FRV)$	Delay time, CLKR high to internal FSR valid	CLKR int	0	4
			CLKR ext	3	27
M5	$t_d(CKXH-FXV)$	Delay time, CLKX high to internal FSX valid	CLKX int	0	4
			CLKX ext	3	27
M6	$t_{dis}(CKXH-DXHZ)$	Disable time, CLKX high to DX high impedance following last data bit	CLKX int		8
			CLKX ext		14
M7	$t_d(CKXH-DXV)$	Delay time, CLKX high to DX valid. This applies to all bits except the first bit transmitted.	CLKX int		9
			CLKX ext		28
		Delay time, CLKX high to DX valid  Only applies to first bit transmitted when in Data Delay 1 or 2 (XDATDLY=01b or 10b) modes	DXENA = 0	CLKX int	8
				CLKX ext	14
			DXENA = 1	CLKX int	P + 8
				CLKX ext	P + 14
		Enable time, CLKX high to DX driven  Only applies to first bit transmitted when in Data Delay 1 or 2 (XDATDLY=01b or 10b) modes	DXENA = 0	CLKX int	0
				CLKX ext	6
			DXENA = 1	CLKX int	P
				CLKX ext	P + 6
M9	$t_d(FXH-DXV)$	Delay time, FSX high to DX valid	DXENA = 0	FSX int	8
				FSX ext	14
		Only applies to first bit transmitted when in Data Delay 0 (XDATDLY=00b) mode.	DXENA = 1	FSX int	P + 8
				FSX ext	P + 14
M10	$t_{en}(FXH-DX)$	Enable time, FSX high to DX driven	DXENA = 0	FSX int	0
				FSX ext	6
		Only applies to first bit transmitted when in Data Delay 0 (XDATDLY=00b) mode	DXENA = 1	FSX int	P
				FSX ext	P + 6

<sup>†</sup> Polarity bits CLKRP = CLKXP = FSRP = FSXP = 0. If the polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> 2P = 1/CLKG in ns.

<sup>§</sup> C=CLKRX low pulse width = P

D=CLKRX high pulse width = P

Figure 6-41. McBSP Receive Timing

## 6.32 Flash Timing (F281x Only)

### 6.32.1 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
N <sub>f</sub>	Flash endurance for the array (Write/erase cycles)	0°C to 85°C	100	1000		cycles
NOTP	OTP endurance for the array (Write cycles)	0°C to 85°C			1	write

Table 6-54. Flash Parameters at 150-MHz SYSCLKOUTT

PARAMETER		MIN	TYP	MAX	UNIT
Program Time	16-Bit Word			35	μs
	8K Sector			170	ms
	16K Sector			320	ms
Erase Time	8K Sector			10	s
	16K Sector			11	s
I <sub>DD3VFLP</sub>	V <sub>DD3VFL</sub> current consumption during the Erase/Program cycle	Erase	75	mA	
		Program	35	mA	
I <sub>DDP</sub>	V <sub>DD</sub> current consumption during Erase/Program cycle		140	mA	
I <sub>DDIOP</sub>	V <sub>DDIO</sub> current consumption during Erase/Program cycle		20	mA	

† Typical parameters as seen at room temperature using flash API V1 including function call overhead.

Table 6-55. Flash/OTP Access Timing

PARAMETER		MIN	TYP	MAX	UNIT
t <sub>a(fp)</sub>	Paged Flash access time	36			ns
t <sub>a(fr)</sub>	Random Flash access time	36			ns
t <sub>a(OTP)</sub>	OTP access time	60			ns

NOTE: For 150 MHz, PAGE WS = 5 and RANDOM WS = 5

For 135 MHz, PAGE WS = 4 and RANDOM WS = 4

Table 6-56. Minimum Required Wait-States at Different Frequencies

SYSCLKOUT (MHz)	SYSCLKOUT (ns)	PAGE WAIT-STATE <sup>†</sup>	RANDOM WAIT STATE <sup>†\$</sup>
150	6.67	5	5
120	8.33	4	4
100	10	3	3
75	13.33	2	2
50	20	1	1
30	33.33	1	1
25	40	0	1
15	66.67	0	1
4	250	0	1

† Formulas to compute page wait state and random wait state:

$$\text{Page Wait State} = \left[ \left( \frac{t_{a(fp)}}{t_{c(SCO)}} \right) - 1 \right] \text{ (round up to the next highest integer), or 0 whichever is larger}$$

$$\text{Random Wait State} = \left[ \left( \frac{t_{a(fr)}}{t_{c(SCO)}} \right) - 1 \right] \text{ (round up to the next highest integer), or 1 whichever is larger}$$

§ Random wait state must be greater than or equal to 1

## REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SGUS051 device-specific data sheet to make it an SGUS051A revision.

Global change: Added ZHH package and fixed table numbering that was displaying incorrect section number.

PAGE(S) NO.	ADDITIONS/CHANGES/DELETIONS
13	Changed notes on Table 2-1
21	Changed descriptions of signals ADCREFP and ADCREFM
41	Added device ID for silicon Revision E to Table 3-7, Device Emulation Registers
64	Changed title of Figure 4-5, ADC Pin Connections With Internal Reference and added Note C
65	Added Figure 4-6, ADC Pin Connections With External Reference
93	Changed legend in Figure 6-3 for clarity
106	The wakeup timings for STANDBY mode are now stated in terms of OSCCKLK cycles in Table 6-11.
136	Added Note 3 (subsequent note numbers changed due to order of notes) to Table 6-39, DC Specifications. The notes have been resequenced and new notes have been added. Check Notes 1 through 7 for changes. Added a value to the MIN column for "Overall gain error with internal reference".
126	Added $t_e(XRDYsynchH)$ to the following: Table 6-32, Synchronous XREADY Timing Requirements (Ready-on-Read) Table 6-33, Asynchronous XREADY Timing Requirements (Ready-on-Read)
127	Figure 6-31, Example Read With Synchronous XREADY Access
128	Figure 6-32, Example Read With Asynchronous XREADY Access
129	Table 6-35, Synchronous XREADY Timing Requirements (Ready-on-Write)
129	Table 6-36, Asynchronous XREADY Timing Requirements (Ready-on-Write)
130	Figure 6-33, Write With Synchronous XREADY Access
131	Figure 6-34, Write With Asynchronous XREADY Access

**PACKAGING INFORMATION**

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
