

1MHz Step-Down Converter/LDO Regulator

General Description

The AAT2500 is a member of Skyworks' Total Power Management IC™ (TPMIC™) product family. It is a low dropout (LDO) linear regulator and a step-down converter with an input voltage range of 2.7V to 5.5V, making it ideal for applications with single lithium-ion/polymer batteries.

The LDO has an independent input and is capable of delivering up to 300mA. The linear regulator has been designed for high-speed turn-on and turn-off performance, fast transient response, and good power supply rejection ratio (PSRR). Other features include low quiescent current and a low dropout voltage.

The 400mA step-down converter is designed to minimize external component size and cost while maintaining a low 25µA no load quiescent current.

Peak current mode control with internal compensation provides a stable converter with a low equivalent series resistance (ESR) ceramic output capacitor for extremely low output ripple.

For maximum battery life, the step-down converter increases to 100% duty cycle and has a typical 180mV dropout voltage at 400mA. The output voltage is either fixed or adjustable with an integrated P- and N-channel MOSFET power stage and 1MHz switching frequency.

The AAT2500 is available in a 12-pin TDFN33 package, and is rated over a temperature range of -40°C to +85°C.

Features

- V_{IN} Range: 2.7V to 5.5V
- 300mA LDO Current Output
- 400mV LDO Dropout Voltage at 300mA
- High Output Accuracy: $\pm 1.5\%$
- Fast LDO Line / Load Transient Response
- 400mA, 96% Efficiency Step-Down Converter
- 25µA No Load Quiescent Current for Step-Down Converter
- Shutdown Current $< 1\mu A$
- Low $R_{DS(ON)}$ 0.4Ω Integrated Power Switches
- Low Dropout 100% Duty Cycle
- 1MHz Switching Frequency
- Internal Soft Start
- Over-Temperature Protection
- Current Limit Protection
- Available in TDFN33-12 Package
- -40°C to +85°C Temperature Range

Applications

- Cellular Phones
- Digital Cameras
- Handheld Instruments
- Microprocessor/DSP Core/IO Power
- PDAs and Handheld Computers
- Portable Media Players

Typical Application

AAT2500 Step-Down Converter Efficiency

1MHz Step-Down Converter/LDO Regulator**Pin Descriptions**

Pin #	Symbol	Function
1	PGND	Step-down converter power ground return pin. Connect to the output and input capacitor return. See section on PCB layout guidelines and evaluation board layout diagram.
2	LX	Power switching node. Output switching node that connects to the output inductor.
3	VP	Step-down converter power stage supply voltage. Must be closely decoupled to PGND.
4	VCC	Step-down converter bias supply. Connect to VP.
5	VLDO	LDO input voltage; should be decoupled with 1 μ F or greater capacitor.
6	OUT	300mA LDO output pin. A 2.2 μ F or greater output low-ESR ceramic capacitor is required for stability.
7	BYP	Bypass capacitor for the LDO. To improve AC ripple rejection, connect a 10nF capacitor to GND. This will also provide a soft-start function.
8	GND	LDO ground connection pin.
9	ENLDO	Enable pin for LDO. When connected low, LDO is disabled and consumes less than 1 μ A of current.
10	EN	Step-down converter enable. When connected low, LDO is disabled and consumes less than 1 μ A.
11	FB	Step-down converter feedback input pin. For fixed output voltage versions, this pin is connected to the converter output, forcing the converter to regulate to the specific voltage. For adjustable output versions, an external resistive divider ties to this point and programs the output voltage to the desired value.
12	SGND	Step-down converter signal ground. For external feedback, return the feedback resistive divider to this ground. For internal fixed version, tie to the point of load return. See section on PCB layout guidelines and evaluation board layout diagram.
EP		Exposed paddle (bottom). Use properly sized vias for thermal coupling to the ground plane. See section on PCB layout guidelines.

Pin Configuration**TDFN33-12
(Top View)**

1MHz Step-Down Converter/LDO Regulator**Absolute Maximum Ratings¹**

Symbol	Description	Value	Units
V_P, V_{LDO}	Input Voltages to GND	6.0	V
V_{LX}	LX to GND	-0.3 to $V_P + 0.3$	V
V_{FB}	FB to GND	-0.3 to $V_P + 0.3$	V
V_{EN}	EN to GND	-0.3 to 6.0	V
T_J	Operating Junction Temperature Range	-40 to 150	°C
T_{LEAD}	Maximum Soldering Temperature (at leads, 10 sec)	300	°C

Thermal Information

Symbol	Description	Value	Units
P_D	Maximum Power Dissipation	2	W
θ_{JA}	Thermal Resistance ²	50	°C/W

1. Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum Rating should be applied at any one time.

2. Mounted on an FR4 board with exposed paddle connected to ground plane.

AAT2500

1MHz Step-Down Converter/LDO Regulator

Electrical Characteristics¹

$V_{IN} = V_{LDO} = V_{OUT(NOM)} + 1V$ for V_{OUT} options greater than 1.5V. $V_{IN} = V_{LDO} = 2.5V$ for $V_{OUT} \leq 1.5V$. $I_{OUT} = 1mA$, $C_{OUT} = 2.2\mu F$, $C_{IN} = 1\mu F$, $T_A = -40^\circ C$ to $+85^\circ C$, unless otherwise noted. Typical values are $T_A = 25^\circ C$.

Symbol	Description	Conditions	Min	Typ	Max	Units
LDO						
V_{OUT}	Output Voltage Tolerance	$I_{OUT} = 1mA$ to 300mA	$T_A = 25^\circ C$	-1.5	1.5	%
			$T_A = -40^\circ C$ to $85^\circ C$	-2.5	2.5	
V_{IN}	Input Voltage		$V_{OUT} + V_{DO}^2$		5.5	V
V_{DO}	Dropout Voltage ^{3, 4}	$I_{OUT} = 300mA$		400	600	mV
$\frac{\Delta V_{OUT}}{V_{OUT}} \cdot \Delta V_{IN}$	Line Regulation	$V_{IN} = V_{OUT} + 1V$ to 5V			0.09	%/V
$\Delta V_{OUT(Line)}$	Dynamic Line Regulation	$I_{OUT} = 300mA$, $V_{IN} = V_{OUT} + 1V$ to $V_{OUT} + 2V$, $T_R/T_F = 2\mu s$		2.5		mV
$\Delta V_{OUT(Load)}$	Dynamic Load Regulation	$I_{OUT} = 1mA$ to 300mA, $T_R < 5\mu s$		60		mV
I_{OUT}	Output Current	$V_{OUT} > 1.3V$	300			mA
I_{SC}	Short-Circuit Current	$V_{OUT} < 0.4V$		600		mA
I_{QLDO}	LDO Quiescent Current	$V_{IN} = 5V$, No Load, $ENLDO = V_{IN}$		70	125	μA
I_{SHDN}	Shutdown Current	$V_{IN} = 5V$; $ENLDO = GND$, $EN = SGND = PGND$			1.0	μA
PSRR	Power Supply Rejection Ratio	$I_{OUT} = 10mA$, $C_{BYP} = 10nF$	1kHz	67		dB
			10kHz	47		
			1MHz	45		
T_{SD}	Over-Temperature Shutdown Threshold			145		$^\circ C$
T_{HYS}	Over-Temperature Shutdown Hysteresis			12		$^\circ C$
e_N	Output Noise	$e_{NBW} = 300Hz$ to 50kHz		50		μV_{RMS}
T_C	Output Voltage Temperature Coefficient			22		ppm/ $^\circ C$

1. The AAT2500 is guaranteed to meet performance specifications over the $-40^\circ C$ to $+85^\circ C$ operating temperature range and is assured by design, characterization, and correlation with statistical process controls.

2. To calculate the minimum LDO input voltage, use the following equation: $V_{IN(MIN)} = V_{OUT(MAX)} + V_{DO(MAX)}$, as long as $V_{IN} \geq 2.5V$.

3. For $V_{OUT} < 2.1V$, $V_{DO} = 2.5 - V_{OUT}$.

4. V_{DO} is defined as $V_{IN} - V_{OUT}$ when V_{OUT} is 98% of nominal.

1MHz Step-Down Converter/LDO Regulator

Functional Block Diagram

Note: Internal resistor divider included for $\geq 1.2V$ versions. For low voltage versions, the feedback pin is tied directly to the error amplifier input.

Functional Description

The AAT2500 is a high performance power management IC comprised of a buck converter and a linear regulator. The buck converter is a high efficiency converter capable of delivering up to 400mA. Designed to operate at 1.0MHz, the converter requires only three external components (C_{IN} , C_{OUT} , and L_X) and is stable with a ceramic output capacitor. The linear regulator delivers 300mA and is also stable with ceramic capacitors.

Linear Regulator

The advanced circuit design of the linear regulator has been specifically optimized for very fast start-up and shutdown timing. This proprietary CMOS LDO has also been tailored for superior transient response character-

istics. These traits are particularly important for applications that require fast power supply timing.

The high-speed turn-on capability is enabled through implementation of a fast-start control circuit, which accelerates the power-up behavior of fundamental control and feedback circuits within the LDO regulator. Fast turn-off time response is achieved by an active output pull-down circuit, which is enabled when the LDO regulator is placed in shutdown mode. This active fast shutdown circuit has no adverse effect on normal device operation. The LDO regulator output has been specifically optimized to function with low-cost, low-ESR ceramic capacitors; however, the design will allow for operation over a wide range of capacitor types.

A bypass pin has been provided to allow the addition of an optional voltage reference bypass capacitor to reduce

AAT2500

1MHz Step-Down Converter/LDO Regulator

output self noise and increase power supply ripple rejection. Device self noise and PSRR will be improved by the addition of a small ceramic capacitor in this pin. However, increased values of C_{BYPASS} may slow down the LDO regulator turn-on time. The regulator comes with complete short-circuit and thermal protection. The combination of these two internal protection circuits gives a comprehensive safety system to guard against extreme adverse operating conditions.

The regulator features an enable/disable function. This pin (ENLDO) is active high and is compatible with CMOS logic. To assure the LDO regulator will switch on, the ENLDO turn-on control level must be greater than 1.5V. The LDO regulator will go into the disable shutdown mode when the voltage on the EN pin falls below 0.6V. If the enable function is not needed in a specific application, it may be tied to V_{IN} to keep the LDO regulator in a continuously on state.

When the regulator is in shutdown mode, an internal 1.5k Ω resistor is connected between OUT and GND. This is intended to discharge C_{OUT} when the LDO regulator is disabled. The internal 1.5k Ω resistor has no adverse impact on device turn-on time.

Step-Down Converter

The AAT2500 buck is a constant frequency peak current mode PWM converter with internal compensation. It is designed to operate with an input voltage range of 2.7V to 5.5V. The output voltage ranges from 0.6V to the input voltage for the internally fixed version, and up to 2.5V for the externally adjustable version. The 0.6V fixed model shown in Figure 1 is also the adjustable version and is externally programmable with a resistive divider, as shown in Figure 2. The converter MOSFET power stage is

sized for 400mA load capability with up to 96% efficiency. Light load efficiency exceeds 80% at a 500 μ A load.

Soft Start

The AAT2500 soft-start control prevents output voltage overshoot and limits inrush current when either the input power or the enable input is applied. When pulled low, the enable input forces the converter into a low-power, non-switching state with a bias current of less than 1 μ A.

Low Dropout Operation

For conditions where the input voltage drops to the output voltage level, the converter duty cycle increases to 100%. As 100% duty cycle is approached, the minimum off-time initially forces the high side on-time to exceed the 1MHz clock cycle and reduce the effective switching frequency. Once the input drops below the level where the output can be regulated, the high side P-channel MOSFET is turned on continuously for 100% duty cycle. At 100% duty cycle, the output voltage tracks the input voltage minus the IR drop of the high side P-channel MOSFET $R_{\text{DS(ON)}}$.

Low Supply

The under-voltage lockout (UVLO) guarantees sufficient V_{IN} bias and proper operation of all internal circuitry prior to activation.

Fault Protection

For overload conditions, the peak inductor current is limited. Thermal protection disables switching when the internal dissipation or ambient temperature becomes excessive. The junction over-temperature threshold is 140°C with 15°C of hysteresis.

1MHz Step-Down Converter/LDO Regulator

Figure 2: AAT2500 with Adjustable Step-Down Output and Enhanced Transient Response.

Applications Information

Linear Regulator

Input and Output Capacitors

An input capacitor is not required for basic operation of the linear regulator. However, if the AAT2500 is physically located more than three centimeters from an input power source, a C_{IN} capacitor will be needed for stable operation. Typically, a $1\mu\text{F}$ or larger capacitor is recommended for C_{IN} in most applications. C_{IN} should be located as closely to the device V_{IN} pin as practically possible.

An input capacitor greater than $1\mu\text{F}$ will offer superior input line transient response and maximize power supply ripple rejection. Ceramic, tantalum, or aluminum electrolytic capacitors may be selected for C_{IN} . There is no specific capacitor ESR requirement for C_{IN} . However, for 300mA LDO regulator output operation, ceramic capacitors are recommended for C_{IN} due to their inherent capability over tantalum capacitors to withstand input current surges from low impedance sources such as batteries in portable devices.

For proper load voltage regulation and operational stability, a capacitor is required between OUT and GND. The C_{OUT} capacitor connection to the LDO regulator ground pin should be made as directly as practically possible for maximum device performance. Since the regulator has been designed to function with very low ESR capacitors, ceramic capacitors in the $1.0\mu\text{F}$ to $10\mu\text{F}$ range are recommended for best performance. Applications utilizing the exceptionally low output noise and optimum power

supply ripple rejection should use $2.2\mu\text{F}$ or greater for C_{OUT} . In low output current applications, where output load is less than 10mA, the minimum value for C_{OUT} can be as low as $0.47\mu\text{F}$.

Equivalent Series Resistance

ESR is a very important characteristic to consider when selecting a capacitor. ESR is the internal series resistance associated with a capacitor that includes lead resistance, internal connections, size and area, material composition, and ambient temperature. Typically, capacitor ESR is measured in milliohms for ceramic capacitors and can range to more than several ohms for tantalum or aluminum electrolytic capacitors.

Bypass Capacitor and Low Noise Applications

A bypass capacitor pin is provided to enhance the low noise characteristics of the LDO. The bypass capacitor is not necessary for operation; however, for best device performance, a small ceramic capacitor in the range of 470pF to 10nF should be placed between the bypass pin (BYP) and the device ground pin (GND). To practically realize the highest power supply ripple rejection and lowest output noise performance, it is critical that the capacitor connection between the BYP pin and GND pin be direct and PCB traces should be as short as possible.

DC leakage on this pin can affect the LDO regulator output noise and voltage regulation performance. For this reason, the use of a low leakage, high quality ceramic (NPO or COG type) or film capacitor is highly recommended.

1MHz Step-Down Converter/LDO Regulator

Step-Down Converter

Inductor Selection

The step-down converter uses peak current mode control with slope compensation to maintain stability for duty cycles greater than 50%. The output inductor value must be selected so the inductor current down slope meets the internal slope compensation requirements. The internal slope compensation for the adjustable and low-voltage fixed versions of the AAT2500 is 0.24A/μs. This equates to a slope compensation that is 75% of the inductor current down slope for a 1.5V output and 4.7μH inductor.

$$m = \frac{0.75 \cdot V_o}{L} = \frac{0.75 \cdot 1.5V}{4.7\mu H} = 0.24 \frac{A}{\mu s}$$

This is the internal slope compensation for the adjustable (0.6V) version or low-voltage fixed versions. When externally programming the 0.6V version to 1.5V, the calculated inductance is 7.5μH.

$$L = \frac{0.75 \cdot V_o}{m} = \frac{0.75 \cdot V_o}{0.24A \frac{A}{\mu s}} \approx 3 \frac{\mu s}{A} \cdot V_o$$

$$= 3 \frac{\mu s}{A} \cdot 1.5V = 4.5\mu H$$

In this case, a standard 4.7μH value is selected.

Manufacturer's specifications list both the inductor DC current rating, which is a thermal limitation, and the peak current rating, which is determined by the saturation characteristics. The inductor should not show any appreciable saturation under normal load conditions. Some inductors may meet the peak and average current ratings yet result in excessive losses due to a high DCR. Always consider the losses associated with the DCR and its effect on the total converter efficiency when selecting an inductor.

The 4.7μH CDRH3D16 series inductor selected from Sumida has a 105mΩ DCR and a 900mA DC current rating. At full load, the inductor DC loss is 17mW which gives a 2.8% loss in efficiency for a 400mA, 1.5V output.

Input Capacitor

Select a 4.7μF to 10μF X7R or X5R ceramic capacitor for the input. To estimate the required input capacitor size, determine the acceptable input ripple level (V_{PP}) and solve for C. The calculated value varies with input voltage and is a maximum when V_{IN} is double the output voltage.

$$C_{IN} = \frac{\frac{V_{OBUCK}}{V_{IN}} \cdot \left(1 - \frac{V_{OBUCK}}{V_{IN}}\right)}{\left(\frac{V_{PP}}{I_{OBUCK}} - ESR\right) \cdot F_s}$$

$$\frac{V_{OBUCK}}{V_{IN}} \cdot \left(1 - \frac{V_{OBUCK}}{V_{IN}}\right) = \frac{1}{4} \text{ for } V_{IN} = 2 \cdot V_{OBUCK}$$

$$C_{IN(MIN)} = \frac{1}{\left(\frac{V_{PP}}{I_{OBUCK}} - ESR\right) \cdot 4 \cdot F_s}$$

Always examine the ceramic capacitor DC voltage coefficient characteristics when selecting the proper value. For example, the capacitance of a 10μF, 6.3V, X5R ceramic capacitor with 5.0V DC applied is actually about 6μF.

The maximum input capacitor RMS current is:

$$I_{RMS} = I_{OBUCK} \cdot \sqrt{\frac{V_{OBUCK}}{V_{IN}} \cdot \left(1 - \frac{V_{OBUCK}}{V_{IN}}\right)}$$

The input capacitor RMS ripple current varies with the input and output voltage and will always be less than or equal to half of the total DC load current.

$$\sqrt{\frac{V_{OBUCK}}{V_{IN}} \cdot \left(1 - \frac{V_{OBUCK}}{V_{IN}}\right)} = \sqrt{D \cdot (1 - D)} = \sqrt{0.5^2} = \frac{1}{2}$$

for $V_{IN} = 2 \times V_{OBUCK}$

$$I_{RMS(MAX)} = \frac{I_{OBUCK}}{2}$$

The term $\frac{V_{OBUCK}}{V_{IN}} \cdot \left(1 - \frac{V_{OBUCK}}{V_{IN}}\right)$ appears in both the input voltage ripple and input capacitor RMS current equations and is a maximum when V_{OBUCK} is twice V_{IN} . This is why the input voltage ripple and the input capacitor RMS current ripple are a maximum at 50% duty cycle.

The input capacitor provides a low impedance loop for the edges of pulsed current drawn by the AAT2500. Low ESR/ESL X7R and X5R ceramic capacitors are ideal for this function. To minimize stray inductance, the capacitor should be placed as closely as possible to the IC. This keeps the high frequency content of the input current localized, minimizing EMI and input voltage ripple.

The proper placement of the input capacitor (C2) can be seen in the evaluation board layout in Figure 3.

1MHz Step-Down Converter/LDO Regulator

A laboratory test set-up typically consists of two long wires running from the bench power supply to the evaluation board input voltage pins. The inductance of these wires, along with the low-ESR ceramic input capacitor, can create a high Q network that may affect converter performance. This problem often becomes apparent in the form of excessive ringing in the output voltage during load transients. Errors in the loop phase and gain measurements can also result.

Since the inductance of a short PCB trace feeding the input voltage is significantly lower than the power leads from the bench power supply, most applications do not exhibit this problem.

In applications where the input power source lead inductance cannot be reduced to a level that does not affect the converter performance, a high ESR tantalum or aluminum electrolytic should be placed in parallel with the low ESR, ESL bypass ceramic. This dampens the high Q network and stabilizes the system.

Output Capacitor

The output capacitor limits the output ripple and provides holdup during large load transitions. A 4.7μF to 10μF X5R or X7R ceramic capacitor typically provides sufficient bulk capacitance to stabilize the output during large load transitions and has the ESR and ESL characteristics necessary for low output ripple.

The output voltage droop due to a load transient is dominated by the capacitance of the ceramic output capacitor.

During a step increase in load current, the ceramic output capacitor alone supplies the load current until the loop responds. Within two or three switching cycles, the loop responds and the inductor current increases to match the load current demand. The relationship of the output voltage droop during the three switching cycles to the output capacitance can be estimated by:

$$C_{OUT} = \frac{3 \cdot \Delta I_{LOAD}}{V_{DROOP} \cdot F_S}$$

Once the average inductor current increases to the DC load level, the output voltage recovers. The above equation establishes a limit on the minimum value for the output capacitor with respect to load transients.

The internal voltage loop compensation also limits the minimum output capacitor value to 4.7μF. This is due to its effect on the loop crossover frequency (bandwidth), phase margin, and gain margin. Increased output capacitance will reduce the crossover frequency with greater phase margin.

The maximum output capacitor RMS ripple current is given by:

$$I_{RMS(MAX)} = \frac{1}{2 \cdot \sqrt{3}} \cdot \frac{V_{OUT} \cdot (V_{IN(MAX)} - V_{OUT})}{L \cdot F \cdot V_{IN(MAX)}}$$

Dissipation due to the RMS current in the ceramic output capacitor ESR is typically minimal, resulting in less than a few degrees rise in hot-spot temperature.

Figure 3: AAT2500 Evaluation Board Top Side.

Figure 4: AAT2500 Evaluation Board Bottom Side.

1MHz Step-Down Converter/LDO Regulator**Adjustable Output Resistor Selection**

For applications requiring an adjustable output voltage, the 0.6V version can be externally programmed. Resistors R1 and R2 of Figure 5 program the output to regulate at a voltage higher than 0.6V. To limit the bias current required for the external feedback resistor string while maintaining good noise immunity, the minimum suggested value for R2 is 59kΩ. Although a larger value will further reduce quiescent current, it will also increase the impedance of the feedback node, making it more sensitive to external noise and interference. Table 1 summarizes the resistor values for various output voltages with R2 set to either 59kΩ for good noise immunity or 221kΩ for reduced no load input current.

$$R1 = \left(\frac{V_{OUT}}{V_{REF}} - 1 \right) \cdot R2 = \left(\frac{1.5V}{0.6V} - 1 \right) \cdot 59k\Omega = 88.5k\Omega$$

The adjustable version of the AAT2500, combined with an external feedforward capacitor (C8 in Figures 2 and 5), delivers enhanced transient response for extreme pulsed load applications. The addition of the feedforward capacitor typically requires a larger output capacitor C1 for stability.

V _{OUT} (V)	R2 = 59kΩ R1 (kΩ)	R2 = 221kΩ R1 (kΩ)
0.8	19.6	75
0.9	29.4	113

1. For step-down converter, enhanced transient configuration C8 = 100pF and C1 = 10µF.

1MHz Step-Down Converter/LDO Regulator

Thermal Calculations

There are three types of losses associated with the AAT2500 step-down converter: switching losses, conduction losses, and quiescent current losses. Conduction losses are associated with the $R_{DS(ON)}$ characteristics of the power output switching devices. Switching losses are dominated by the gate charge of the power output switching devices. At full load, assuming continuous conduction mode (CCM), a simplified form of the step-down converter and LDO losses is given by:

$$P_{TOTAL} = \frac{I_{OBUCK}^2 \cdot (R_{DS(ON)(HS)} \cdot V_{OBUCK} + R_{DS(ON)(LS)} \cdot [V_{IN} - V_{OBUCK}])}{V_{IN}} + (t_{sw} \cdot F \cdot I_{OBUCK} + I_{QBUCK} + I_{QLDO}) \cdot V_{IN} + I_{OLDO} \cdot (V_{IN} - V_{OLDO})$$

I_{QBUCK} is the step-down converter quiescent current and I_{QLDO} is the LDO quiescent current. The term t_{sw} is used to estimate the full load step-down converter switching losses.

For the condition where the buck converter is in dropout at 100% duty cycle, the total device dissipation reduces to:

$$P_{TOTAL} = I_{OBUCK}^2 \cdot R_{DS(ON)(HS)} + I_{OLDO} \cdot (V_{IN} - V_{OLDO}) + (I_{QBUCK} + I_{QLDO}) \cdot V_{IN}$$

Since $R_{DS(ON)}$, quiescent current, and switching losses all vary with input voltage, the total losses should be investigated over the complete input voltage range.

Given the total losses, the maximum junction temperature can be derived from the θ_{JA} for the TDFN33-12 package which is 50°C/W.

$$T_{J(MAX)} = P_{TOTAL} \cdot \theta_{JA} + T_{AMB}$$

PCB Layout

The following guidelines should be used to ensure a proper layout.

1. The input capacitor C2 should connect as closely as possible to VP and PGND, as shown in Figure 4.
2. The output capacitor and inductor should be connected as closely as possible. The connection of the inductor to the LX pin should also be as short as possible.
3. The feedback trace should be separate from any power trace and connect as closely as possible to the load point. Sensing along a high-current load trace will degrade DC load regulation. If external feedback resistors are used, they should be placed as closely as possible to the FB pin. This prevents noise from being coupled into the high impedance feedback node.
4. The resistance of the trace from the load return to GND should be kept to a minimum. This will help to minimize any error in DC regulation due to differences in the potential of the internal signal ground and the power ground.
5. For good thermal coupling, PCB vias are required from the pad for the TDFN paddle to the ground plane. The via diameter should be 0.3mm to 0.33mm and positioned on a 1.2mm grid.
6. The LDO bypass capacitor (C5) should be connected directly between Pins 7 (BYP) and 8 (GND).

Step-Down Converter Design Example

Specifications

$V_{\text{OBUCK}} = 1.8\text{V}$ @ 400mA (adjustable using 0.6V version), Pulsed Load $\Delta I_{\text{LOAD}} = 300\text{mA}$

$V_{\text{OLDO}} = 3.3\text{V}$ @ 300mA

$V_{\text{IN}} = 2.7\text{V}$ to 4.2V (3.6V nominal)

$F_s = 1.0\text{MHz}$

$T_{\text{AMB}} = 85^\circ\text{C}$

1.8V Buck Output Inductor

$$L1 = 3 \frac{\mu\text{S}}{\text{A}} \cdot V_{\text{O2}} = 3 \frac{\mu\text{S}}{\text{A}} \cdot 1.8\text{V} = 5.4\mu\text{H} \text{ (see Table 1)}$$

For Sumida inductor CDRH3D16, $4.7\mu\text{H}$, $\text{DCR} = 105\text{m}\Omega$.

$$\Delta I_{L1} = \frac{V_{\text{OBUCK}}}{L1 \cdot F} \cdot \left(1 - \frac{V_{\text{OBUCK}}}{V_{\text{IN}}}\right) = \frac{1.8\text{V}}{4.7\mu\text{H} \cdot 1.0\text{MHz}} \cdot \left(1 - \frac{1.8\text{V}}{4.2\text{V}}\right) = 218\text{mA}$$

$$I_{\text{PKL1}} = I_{\text{OBUCK}} + \frac{\Delta I_{L1}}{2} = 0.4\text{A} + 0.11\text{A} = 0.51\text{A}$$

$$P_{L1} = I_{\text{OBUCK}}^2 \cdot \text{DCR} = 0.4\text{A}^2 \cdot 105\text{m}\Omega = 17\text{mW}$$

1.8V Output Capacitor

$$V_{\text{DROOP}} = 0.2\text{V}$$

$$C_{\text{OUT}} = \frac{3 \cdot \Delta I_{\text{LOAD}}}{V_{\text{DROOP}} \cdot F_s} = \frac{3 \cdot 0.3\text{A}}{0.2\text{V} \cdot 1\text{MHz}} = 4.5\mu\text{F}$$

$$I_{\text{RMS}} = \frac{1}{2 \cdot \sqrt{3}} \cdot \frac{(V_{\text{OBUCK}}) \cdot (V_{\text{IN(MAX)}} - V_{\text{OBUCK}})}{L1 \cdot F \cdot V_{\text{IN(MAX)}}} = \frac{1}{2 \cdot \sqrt{3}} \cdot \frac{1.8\text{V} \cdot (4.2\text{V} - 1.8\text{V})}{4.7\mu\text{H} \cdot 1.0\text{MHz} \cdot 4.2\text{V}} = 63\text{mA}_{\text{RMS}}$$

$$P_{\text{esr}} = \text{esr} \cdot I_{\text{RMS}}^2 = 5\text{m}\Omega \cdot (63\text{mA})^2 = 20\mu\text{W}$$

Input Capacitor

Input Ripple $V_{\text{PP}} = 25\text{mV}$

$$C_{\text{IN}} = \frac{1}{\left(\frac{V_{\text{PP}}}{I_{\text{OBUCK}}} - \text{ESR}\right) \cdot 4 \cdot F_s} = \frac{1}{\left(\frac{25\text{mV}}{0.4\text{A}} - 5\text{m}\Omega\right) \cdot 4 \cdot 1\text{MHz}} = 4.75\mu\text{F}$$

$$I_{\text{RMS}} = \frac{I_{\text{OBUCK}}}{2} = 0.2\text{A}_{\text{RMS}}$$

$$P = \text{esr} \cdot I_{\text{RMS}}^2 = 5\text{m}\Omega \cdot (0.2\text{A})^2 = 0.2\text{mW}$$

AAT2500 Losses

$$P_{\text{TOTAL}} = \frac{I_{\text{OBUCK}}^2 \cdot (R_{\text{DS(on)(HS)}} \cdot V_{\text{OBUCK}} + R_{\text{DS(on)(LS)}} \cdot [V_{\text{IN}} - V_{\text{OBUCK}}])}{V_{\text{IN}}} \\ + (t_{\text{sw}} \cdot F \cdot I_{\text{OBUCK}} + I_{\text{QBUCK}} + I_{\text{QLDO}}) \cdot V_{\text{IN}} + (V_{\text{IN}} - V_{\text{LDO}}) \cdot I_{\text{LDO}}$$

$$= \frac{0.4^2 \cdot (0.725\Omega \cdot 1.8V + 0.7\Omega \cdot [4.2V - 1.8V])}{4.2V}$$

$$+ (5\text{ns} \cdot 1.0\text{MHz} \cdot 0.4\text{A} + 50\mu\text{A} + 125\mu\text{A}) \cdot 4.2V + (4.2V - 3.3V) \cdot 0.3\text{A} = 392\text{mW}$$

$$T_{\text{J(MAX)}} = T_{\text{AMB}} + \Theta_{\text{JA}} \cdot P_{\text{LOSS}} = 85^\circ\text{C} + (50^\circ\text{C/W}) \cdot 392\text{mW} = 105^\circ\text{C}$$
