HMC905LP3E

v01.0414

6 GHz LOW NOISE PROGRAMMABLE DIVIDER (N = 1 to 4)

Typical Applications

The HMC905LP3E is ideal for:

- LO Generation with Low Noise Floor
- Software Defined Radios
- Clock Generators
- Fast Switching Synthesizers
- Military Applications
- Test Equipment
- Sensors

Features

Low Noise Floor:
-164 dBc/Hz at 10 MHz Offset for N = 4

Programmable Frequency Divider, N = 1, 2, 3 or 4

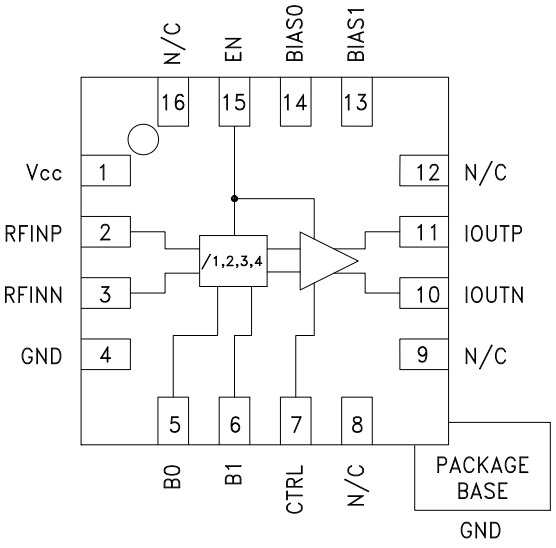
400 MHz to 6 GHz Input Frequency Range

Up to +6 dBm Output Power

Sleep Mode: Consumes <1 µA

16 Lead 3X3 mm SMT Package: $9mm^2$

Functional Diagram



General Description

The HMC905LP3E is a SiGe BiCMOS low noise programmable frequency divider in a 3x3 mm leadless surface mount package. The circuit can be programmed to divide from N = 1 to N = 4 in the 400 MHz to 6 GHz input frequency range. The high level output power (up to 6 dBm single ended) with a very low SSB phase noise and 50% duty cycle makes this device ideal for low noise clock generation, LO generation and LO drive applications. Configurable bias and output power controls allow current consumption and output power control. The device incorporates a power down feature, good input to output isolation and fast start up time. The HMC905LP3E can be included into fast switching "ping-pong" applications.

Electrical Specifications, T_A = +25° C, Vcc = +3.3V, Z_O = 50Ω

Application Note:

The HMC905LP3E is a high performance RF divider. Such dividers are high gain devices with internal feedback. The device will oscillate if used with AC coupled RF inputs and if no RF input is applied. Normally, if the RF input signal is removed the device should be disabled, or it should be placed in divide by 1 mode. The device is stable in divide by one mode with no RF input. The device will oscillate in divide 2, 3, or 4 modes with no RF input. In general, very small RF input levels will stop all oscillations. At the minimum rated RF input sensitivity level or higher, no oscillations or spurious signals exist and excellent low noise performance is achieved. For input frequency lower than 400 MHz, square wave input signal is recommended.

For single ended applications, apply the signal on the positive input RFinp and terminate the unused output with 50 ohms.

[2] Circuit Board Material: Rogers 4350 or Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and backside ground paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
