

CLM6121 / CLM6321

FEATURES

- Slew Rate 1200V/ μ s
- Wide Bandwidth..... 100MHz
- Output current 230mA
- High Input Impedance..... 2M Ω
- No Oscillations with Capacitive Loads
- 5V to $\pm$ 15V Operation Guaranteed
- Current and Thermal Limiting
- Fully Specified to Drive 50 Ω Lines

APPLICATIONS

- Line Driving
- Radar
- Sonar

GENERAL DESCRIPTION

The CLM6121 family are high speed unity gain buffers that slew at 1200V/ μ s, having a small signal bandwidth of 100MHz, and capable of providing a continuous output current of $\pm$ 200mA. They are monolithic ICs which are pin to pin compatible with the LH0002H/CH with the additional feature of current limiting.

The internal output short circuit current limiting feature has been designed in the device such that when the junction temperature reaches 170 $^{\circ}$ C, the current is limited to 100mA.

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions.

Note 2: The CLM6121 series buffers contain current limit and thermal shutdown to protect against fault conditions.

Note 3: Slew rate is measured with a $\pm 11\text{V}$ input pulse and 50Ω source impedance at 25°C . For accurate measurements, the input slew rate should be at least $1700\text{V}/\mu\text{s}$.

Note 4: The test circuit consists of the human body model of 120pF in series with 1500Ω .

Note 5: The maximum power dissipation is a function of $T_{\text{J(max)}}$, θ_{JA} and T_{A} . The maximum allowable power dissipation at any ambient temperature is $P_{\text{D}} = (T_{\text{J(max)}} - T_{\text{A}})/\theta_{\text{JA}}$.

Note 6: Limits are guaranteed by testing, correlation or periodic characterization.

Note 7: For M & N package, θ_{JA} is measured by soldering the unit directly on a printed circuit board and V pins are connected to 2 square inches of 2 oz copper.
