FEATURES

- Low supply current
- Photo detector and preamplifier in one package
- Internal filter for PCM frequency
- Improved shielding against EMI
- Supply voltage: 2.7 V to 5.5 V
- Improved immunity against ambient light
- Insensitive to supply voltage ripple and noise
- Component in accordance to RoHS 2002/95/EC and WEEE 2002/96/EC

COMPLIANT

DESCRIPTION

The TSOP22.. series are miniaturized receivers for infrared remote control systems. A PIN diode and a preamplifier are assembled on a lead frame, the epoxy package acts as an IR filter.

The demodulated output signal can directly be decoded by a microprocessor. The TSOP22.. is the standard IR remote control receiver series, supporting all major data formats.

This component has not been qualified according to automotive specifications.

PARTS TABLE

CARRIER FREQUENCY	STANDARD APPLICATIONS (AGC2/AGC8)
30 kHz	TSOP2230
33 kHz	TSOP2233
36 kHz	TSOP2236
36.7 kHz	TSOP2237
38 kHz	TSOP2238
40 kHz	TSOP2240
56 kHz	TSOP2256

BLOCK DIAGRAM
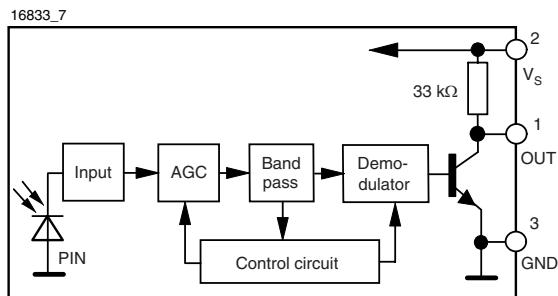

APPLICATION CIRCUIT
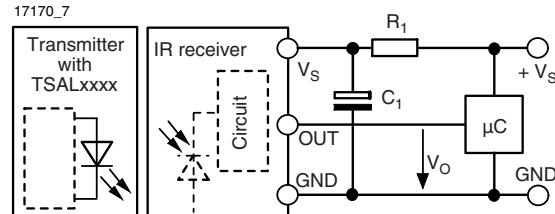

The external components R_1 and C_1 are optional to improve the robustnes against electrical overstress (typical values are R_1 = 100 Ω, C_1 = 0.1 μF).
The output voltage V_O should not be pulled down to a level below 1 V by the external circuit.
The capacitive load at the output should be less than 2 nF.

Output current (pin 1)		I_O	5	mA
Junction temperature		T_j	100	°C
Storage temperature range		T_{stg}	- 25 to + 85	°C
Operating temperature range		T_{amb}	- 25 to + 85	°C
Power consumption	$T_{amb} \leq 85$ °C	P_{tot}	10	mW
Soldering temperature	$t \leq 10$ s, 1 mm from case	T_{sd}	260	°C

Note

[1] Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating condtions for extended periods may affect the device reliability.

SUITABLE DATA FORMAT

The TSOP22.. series is designed to suppress spurious output pulses due to noise or disturbance signals. Data and disturbance signals can be distinguished by the devices according to carrier frequency, burst length and envelope duty cycle. The data signal should be close to the band-pass center frequency (e.g. 38 kHz) and fulfill the conditions in the table below.

When a data signal is applied to the TSOP22.. in the presence of a disturbance signal, the sensitivity of the receiver is reduced to insure that no spurious pulses are present at the output. Some examples of disturbance signals which are suppressed are:

- DC light (e.g. from tungsten bulb or sunlight)

- Continuous signals at any frequency

- Strongly or weakly modulated noise from fluorescent lamps with electronic ballasts (see figure 14 or figure 15)

	TSOP22..
Minimum burst length	10 cycles/burst
After each burst of length a minimum gap time is required of	10 to 70 cycles $\geq$ 12 cycles
For bursts greater than a minimum gap time in the data stream is needed of	70 cycles > 4 x burst length
Maximum number of continuous short bursts/second	800
Recommended for NEC code	yes
Recommended for RC5/RC6 code	yes
Recommended for Sony code	yes
Recommended for Thomson 56 kHz code	yes
Recommended for Mitsubishi code (38 kHz, preburst 8 ms, 16 bit)	yes
Recommended for Sharp code	yes
Suppression of interference from fluorescent lamps	Most common disturbance signals are suppressed

Note

For data formats with short bursts please see the datasheet of TSOP21..
