- (1) Bass and Treble response see attached diagram (fig.16). The center frequency and quality of the resonance behaviour can be chosen by the external circuitry. A standard first order bass response can be realized by a standard feedback network
- (2) The selected input is grounded thru the 2.2 $\mu F$  capacitor.

### I<sup>2</sup>C BUS INTERFACE

Data transmission from microprocessor to the TDA7313N and viceversa takes place thru the 2 wires I<sup>2</sup>C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

#### Data Validity

As shown in fig. 17, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

#### Start and Stop Conditions

As shown in fig.18 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

#### Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

**Figure 16:** Typical Tone Response (with the ext. components indicated in the test circuit)

#### Acknowledge

The master ( $\mu P$ ) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 19). The peripheral (audioprocessor) that acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

#### Transmission without Acknowledge

Avoiding to detect the acknowledge of the audioprocessor, the  $\mu P$  can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking and decreases the noise immunity.

**Figure 17:** Data Validity on the I<sup>2</sup>C BUS

**Figure 18:** Timing Diagram of I<sup>2</sup>C BUS**Figure 19:** Acknowledge on the I<sup>2</sup>C BUS**SOFTWARE SPECIFICATION****Interface Protocol**

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7313N

address (the 8th bit of the byte must be 0). The TDA7313N must always acknowledge at the end of each transmitted byte.

- A sequence of data (N-bytes + acknowledge)
- A stop condition (P)

ACK = Acknowledge

S = Start

P = Stop

MAX CLOCK SPEED 100kbts/s
