

DUAL 1:3 LOW-JITTER BUFFER/LEVEL TRANSLATOR

Features

- 6 differential or 12 (in phase) LVCMOS outputs
- Ultra-low additive jitter: 45 fs rms
- Wide frequency range: 1 to 725 MHz
- Any-format input with pin selectable output formats: LVPECL, low power LVPECL, LVDS, CML, HCSL, LVCMOS
- Synchronous output enable
- Output clock division: /1, /2, /4
- Low output-output skew: 25 ps
- Loss of signal (LOS) monitors for loss of input clock
- Independent V_{DD} and V_{DDO} : 1.8/2.5/3.3 V
- Selectable LVCMOS drive strength to tailor jitter and EMI performance
- Small size: 32-QFN (5 mm x 5 mm)
- RoHS compliant, Pb-free
- Industrial temperature range: -40 to +85 °C

Applications

- High-speed clock distribution
- Ethernet switch/router
- Optical Transport Network (OTN)
- SONET/SDH
- PCI Express Gen 1/2/3
- Storage
- Telecom
- Industrial
- Servers
- Backplane clock distribution

Description

The Si53308 is an ultra low jitter six output differential buffer with pin-selectable output clock signal format and divider selection. The device is a dual 1:3 buffer providing the functionality of two independent buffers in a single IC. The Si53308 utilizes Silicon Laboratories' advanced CMOS technology to fanout clocks from 1 to 725 MHz with guaranteed low additive jitter, low skew, and low propagation delay variability. The Si53308 features minimal cross-talk and provides superior supply noise rejection, simplifying low jitter clock distribution in noisy environments. Independent core and output bank supply pins provide integrated level translation without the need for external circuitry.

2. Functional Description

The Si53308 is a low-jitter, low-skew, dual 1:3 differential output buffer. The device has a universal input that accepts most common differential or LVCMOS input signals. Each output bank features control pins to select signal format, output enable, output divider setting and LVCMOS drive strength.

2.1. Universal, Any-Format Input

The Si53308 has a universal input stage that enables simple interfacing to a wide variety of clock formats, including LVPECL, low-power LVPECL, LVCMOS, LVDS, HCSL, and CML. Tables 15 and 16 summarize the various ac- and dc-coupling options supported by the device. Figures 3 and 4 show the recommended input clock termination options. For the best high-speed performance, the use of differential formats is recommended. For both single-ended and differential input clocks, the fastest possible slew rate is recommended since low slew rates can increase the noise floor and degrade jitter performance. Though not required, a minimum slew rate of 0.75 V/ns is recommended for differential formats and 1.0 V/ns for single-ended formats.

2.2. Input Bias Resistors

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The noninverting input is biased with a 18.75 k Ω pulldown to GND and a 75 k Ω pullup to V_{DD}. The inverting input is biased with a 75 k Ω pullup to V_{DD}.

Figure 5. Input Bias Resistors

2.3. Universal, Any-Format Output Buffer

The Si53308 has highly flexible output drivers that support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMOS. SFOUTX[1] and SFOUTX[0] are 3-level inputs that can be pin-strapped to select the Bank A or Bank B clock signal formats. This feature enables the device to be used for format translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMOS drive strength options are available for each V_{DDO} setting.

Table 17. Output Signal Format Selection

***Note:** SFOUTX are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin floats to V_{DD}/2.

2.4. Synchronous Output Enable

The Si53308 features a synchronous output enable (disable) feature. Output enable is sampled and synchronized on the falling edge of the input clock. This feature prevents runt pulses from being generated when the outputs are enabled or disabled.

When OE is low, Q is held low and $\overline{Q}$ is held high for differential output formats. For LVCMOS output format options, both Q and $\overline{Q}$ are held low when OE is set low. The device outputs are enabled when the output enable pin is unconnected. See Table 9, “Output Characteristics—HCSL,” on page 7 for output enable and output disable times.

2.5. Flexible Output Divider

The Si53308 provides optional clock division in addition to clock distribution. The divider setting for each bank of output clocks is selected via 3-level control pins as shown in the table below. Leaving the DIVX pins open will force a divider value of 1 which is the default mode of operation.

Table 18. Post Divider Selection

DIVX	Divider Value
Open*	÷1 (default)
0	÷2
1	÷4
*Note: DIVX are 3-level input pins. Tie low for “0” setting. Tie high for “1” setting. When left open, the pin floats to VDD/2.	

2.6. Output Enable Logic

Each 1:3 output has an independent clock input (CLK0/CLK1) and an output enable pin. Table 19 summarizes the input and output clock based upon the state of the input clock and the OE pin.

Table 19. Input Clock and Output Enable Logic

CLK	OE ¹	Q ²
L	H	L
H	H	H
X	L	L ³
Notes: 1. Output enable active high. 2. On the next negative transition of CLK0 or CLK1. 3. Single-end: Q = low, $\overline{Q}$ = low. Differential: Q = low, $\overline{Q}$ = high.		

2.7. Loss of Signal (LOS) Indicator

The LOS0 and LOS1 indicators monitor for the presence of input clocks CLK0 and CLK1, respectively. In the event that an input clock is not present, the associated LOSx pin will assume a logic high (LOSx = 1) state. When a clock is present at the associated input clock pin, the LOSx pin will assume a logic low (LOSx = 0) state.

2.8. Power Supply (V_{DD} and V_{DDOX})

The device includes separate core (V_{DD}) and output driver supplies (V_{DDOX}). This feature allows the core to operate at a lower voltage than V_{DDO}, reducing current consumption in mixed supply applications. The core V_{DD} supports 3.3 V, 2.5 V, or 1.8 V. Each output bank has its own V_{DDOX} supply, supporting 3.3 V, 2.5 V, or 1.8 V.

2.9. Output Clock Termination Options

The recommended output clock termination options are shown below. Unused outputs can be left floating. Do not short unused outputs to ground.

2.11. Typical Phase Noise Performance

Each of the following three figures shows three phase noise plots superimposed on the same diagram.

Source Jitter: Reference clock phase noise.

Total Jitter (SE): Combined source and clock buffer phase noise measured as a single-ended output to the phase noise analyzer and integrated from 12 kHz to 20 MHz.

Total Jitter (Diff'l): Combined source and clock buffer phase noise measured as a differential output to the phase noise analyzer and integrated from 12 kHz to 20 MHz. The differential measurement as shown in each figure is made using a balun. See Figure 1 on page 11.

Note: To calculate the total RMS phase jitter when adding a buffer to your clock tree, use the root-sum-square (RSS).

The total jitter is a measure of the source plus the buffer's additive phase jitter. The additive jitter (rms) of the buffer can then be calculated (via root-sum-square addition).

Frequency (MHz)	Diff'l Input Slew Rate (V/ns)	Source Jitter (fs)	Total Jitter (SE) (fs)	Additive Jitter (SE) (fs)	Total Jitter (Diff'l) (fs)	Additive Jitter (Diff'l) (fs)

2.13. Power Supply Noise Rejection

The device supports on-chip supply voltage regulation to reject noise present on the power supply, simplifying low jitter operation in real-world environments. This feature enables robust operation alongside FPGAs, ASICs and SoCs and may reduce board-level filtering requirements. For more information, see “AN491: Power Supply Rejection for Low Jitter Clocks”.

Table 21. Pin Description

Pin	Name	Description
1	DIVA	Output divider control pin for Bank A. Three-level input control. Internally biased at $V_{DD}/2$. Can be left floating or tied to ground or V_{DD} .
2	SFOUTA[1]	Output signal format control pin for Bank A. Three-level input control. Internally biased at $V_{DD}/2$. Can be left floating or tied to ground or V_{DD} .
3	SFOUTA[0]	Output signal format control pin for Bank A. Three-level input control. Internally biased at $V_{DD}/2$. Can be left floating or tied to ground or V_{DD} .
4	$\overline{Q0}$	Output clock 2 (complement).
5	Q0	Output clock 2.
6	GND	Ground.
7	V_{DD}	Core voltage supply. Bypass with 1.0 μ F capacitor and place close to the V_{DD} pin as possible.
8	NC	No connect.

Table 21. Pin Description (Continued)

Pin	Name	Description
9	LOS0	The LOS0 status pin indicates whether a clock is present (LOS0 = 0) or not present (LOS0 = 1) at the CLK0 pin.
10	CLK0	Input clock 0.
11	$\overline{\text{CLK0}}$	Input clock 0 (complement). When CLK0 is driven by a single-end input, connect $\overline{\text{CLK0}}$ to VDD/2.
12	OEA	Output enable—Bank A. When OE = high, the Bank A outputs are enabled. When OE = low, Q is held low and /Q is held high for differential formats. For LVCMOS, both Q and /Q are held low when OE is set low. OEA contains an internal pull-up resistor.
13	OEB	Output enable—Bank B. When OE = high, the Bank B outputs are enabled. When OE = low, Q is held low and /Q is held high for differential formats. For LVCMOS, both Q and /Q are held low when OE is set low. OEB contains an internal pull-up resistor.
14	CLK1	Input clock 1.
15	$\overline{\text{CLK1}}$	Input clock 1 (complement). When CLK1 is driven by a single-end input, connect $\overline{\text{CLK1}}$ to VDD/2.
16	LOS1	The LOS1 status pin indicates whether a clock is present (LOS1 = 0) or not present (LOS1 = 1) at the CLK1 pin.
17	V _{REF}	Input reference voltage.
18	V _{DDO} A	Output Clock Voltage Supply—Bank A (Outputs: Q0 to Q2). Bypass with 1.0 μ F capacitor and place close to the V _{DDO} A pin as possible.
19	V _{DDO} B	Output Clock Voltage Supply—Bank B (Outputs: Q3 to Q5). Bypass with 1.0 μ F capacitor and place close to the V _{DDO} B pin as possible.
20	$\overline{\text{Q5}}$	Output clock 5 (complement).
21	Q5	Output clock 5.
22	SFOUTB[0]	Output signal format control pin for Bank B. Three-level input control. Internally biased at VDD/2. Can be left floating or tied to ground or V _{DD} .

Notes:

General

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

Solder Mask Design

3. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μ m minimum, all the way around the pad.

Stencil Design

4. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
5. The stencil thickness should be 0.125 mm (5 mils).
6. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
7. A 2x2 array of 0.75 mm square openings on 1.15 mm pitch should be used for the center ground pad.

Card Assembly

8. A No-Clean, Type-3 solder paste is recommended.
9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.
