NOTES:

- Add $.01^{\circ}\text{C/W}$ to account for both case to dissipator interfaces when properly mounted; e.g., $R_{\theta JS} = .06^{\circ}\text{C}$.
- DC Thermal Impedance is based on average full cycle junction temperature. Instantaneous junction temperature may be calculated using the following modifications:
 - end of conducting portion of cycle
 - 120° sq. wave add $.0065^{\circ}\text{C/W}$ along entire curve
 - 180° sq. wave add $.0047^{\circ}\text{C/W}$ along entire curve
 - 180° sine wave add $.0026^{\circ}\text{C/W}$ along entire curve
 - end of full cycle
 - any wave, subtract $.0026^{\circ}\text{C/W}$ along entire curve

*Permissible circuit di/dt excluding snubber discharge. Repetitive di/dt is recommended maximum condition to achieve most industrial requirements for service life. It meets or exceeds the JEDEC test requirements for certification set forth in NEMA Std. Sk. 516 (1972). Non-repetitive di/dt meets the JEDEC 5 sec. rating.

**Snubber discharge, i_s , is treated separately using the minimum value of snubber resistance indicated above. This applies for long industrial life (20 – 30 years) in combination with circuit di/dt .
