

GENERAL DESCRIPTION

The ICS87016 is a low skew, 1:16 LVC MOS/LVTTL Clock Generator and is a member of the HiPerClockS™ family of High Performance Clock Solutions. The device has 4 banks of 4 outputs and each bank can be independently selected for $\div 1$ or $\div 2$ frequency operation. Each bank also has its own power supply pins so that the banks can operate at the following different voltage levels: 3.3V, 2.5V, and 1.8V. The low impedance LVC MOS/LVTTL outputs are designed to drive 50 Ω series or parallel terminated transmission lines.

The divide select inputs, DIV_SEL A:DIV_SEL D, control the output frequency of each bank. The output banks can be independently selected for $\div 1$ or $\div 2$ operation. The bank enable inputs, CLK_EN A:CLK_EN D, support enabling and disabling each bank of outputs individually. The CLK_EN A:CLK_EN D circuitry has a synchronizer to prevent runt pulses when enabling or disabling the clock outputs. The master reset input, nMR/OE, resets the $\div 1/\div 2$ flip flops and also controls the active and high impedance states of all outputs. This pin has an internal pull-up resistor and is normally used only for test purposes or in systems which use low power modes.

The ICS87016 is characterized to operate with the core at 3.3V and the banks at 3.3V, 2.5V, or 1.8V. Guaranteed bank, output, and part-to-part skew characteristics make the 87016 ideal for those clock applications demanding well-defined performance and repeatability.

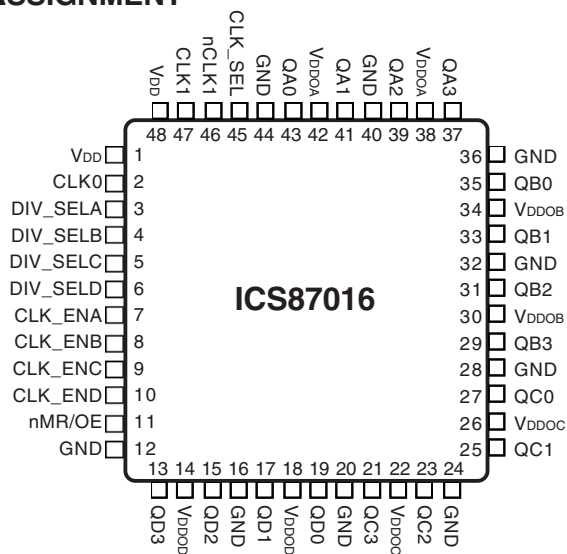

FEATURES

- Sixteen LVC MOS/LVTTL outputs (4 banks of 4 outputs)
- Selectable differential CLK1, nCLK1 or LVC MOS clock input
- CLK1, nCLK1 pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- CLK0 supports the following input types: LVC MOS, LVTTL
- Maximum output frequency: 250MHz
- Independent bank control for $\div 1$ or $\div 2$ operation
- Independent output bank voltage settings for 3.3V, 2.5V, or 1.8V operation
- Asynchronous clock enable/disable
- Output skew: 170ps (maximum)
- Bank skew: 30ps (maximum)
- Part-to-part skew: 750ps (maximum)
- 3.3V core, 3.3V, 2.5V, or 1.8V output operating supply
- 0°C to 85°C ambient operating temperature
- Available in both standard and lead-free RoHS compliant packages

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 48	V _{DD}	Power		Positive supply pins.
2	CLK0	Input	Pulldown	LVCMOS / LVTTL clock input.
3	DIV_SELA	Input	Pullup	Controls frequency division for Bank A outputs. LVCMOS / LVTTL interface levels.
4	DIV_SELB	Input	Pullup	Controls frequency division for Bank B outputs. LVCMOS / LVTTL interface levels..
5	DIV_SELC	Input	Pullup	Controls frequency division for Bank C outputs. LVCMOS / LVTTL interface levels.
6	DIV_SELD	Input	Pullup	Controls frequency division for Bank D outputs. LVCMOS / LVTTL interface levels.
7	CLK_ENA	Input	Pullup	Output enable for Bank A outputs. Active HIGH. If pin is LOW, outputs drive low. LVCMOS / LVTTL interface levels.
8	CLK_ENB	Input	Pullup	Output enable for Bank B outputs. Active HIGH. If pin is LOW, outputs drive low. LVCMOS / LVTTL interface levels.
9	CLK_ENC	Input	Pullup	Output enable for Bank C outputs. Active HIGH. If pin is LOW, outputs drive low. LVCMOS / LVTTL interface levels.
10	CLK_END	Input	Pullup	Output enable for Bank D outputs. Active HIGH. If pin is LOW, outputs drive low. LVCMOS / LVTTL interface levels.
11	nMR/OE	Input	Pullup	Master reset. When LOW, resets the ÷1/÷2 flip flops and sets the outputs to high impedance. LVCMOS / LVTTL interface levels.
12, 16, 20, 24, 28, 32, 36, 40, 44	GND	Power		Power supply ground.
13, 15, 17, 19	QD3, QD2, QD1, QD0	Output		Bank D outputs. LVCMOS / LVTTL interface levels.
14, 18	V _{DDOD}	Power		Output Bank D power supply pins.
21, 23, 25, 27	QC3, QC2, QC1, QC0	Output		Bank C outputs. LVCMOS / LVTTL interface levels.
22, 26	V _{DDOC}	Power		Output Bank C power supply pins.
29, 31, 33, 35	QB3, QB2, QB1, QB0	Output		Bank B outputs. LVCMOS / LVTTL interface levels.
30, 34	V _{DDOB}	Power		Output Bank B power supply pins.
37, 39, 41, 43	QA3, QA2, QA1, QA0	Output		Bank A outputs. LVCMOS / LVTTL interface levels.
38, 42	V _{DDOA}	Power		Output Bank A power supply pins.
45	CLK_SEL	Input	Pulldown	Clock select input. When HIGH, selects CLK1, nCLK1 inputs. When LOW, selects CLK0 input. LVCMOS / LVTTL interface levels.
46	nCLK1	Input	Pullup	Inverting differential clock input.
47	CLK1	Input	Pulldown	Non-inverting differential clock input.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

TABLE 2. PIN CHARACTERISTICS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C_{IN}	Input Capacitance			4		pF
R_{PULLUP}	Input Pullup Resistor			51		k Ω
C_{PD}	Power Dissipation Capacitance (per output); NOTE 1	$V_{DD}, V_{DDOx} = 3.465V$			18	pF
		$V_{DD} = 3.465, V_{DDOx} = 2.625V$			20	pF
		$V_{DD} = 3.465, V_{DDOx} = 1.89V$			30	pF
R_{OUT}	Output Impedance			7		Ω

NOTE 1: V_{DDOx} denotes $V_{DDOA}, V_{DDOB}, V_{DDOC},$ and $V_{DDOD}.$

TABLE 3. FUNCTION TABLE

Inputs			Outputs	
nMR/OE	CLK_ENx	DIV_SELx	Bank X	Qx Frequency

APPLICATION INFORMATION

WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{DD}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{DD} = 3.3V$, V_{REF} should be 1.25V and $R2/R1 = 0.609$.

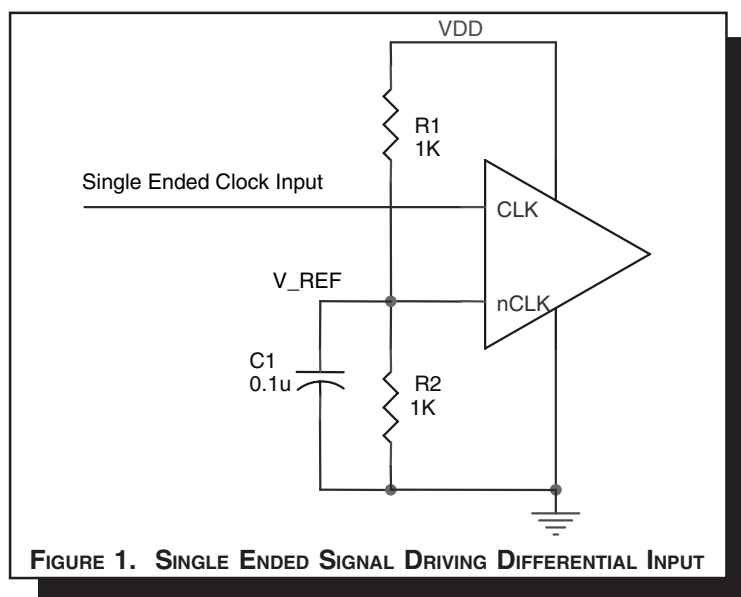

FIGURE 1. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

INPUTS:

CLK INPUT:

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from the CLK input to ground.

CLK/nCLK INPUT:

For applications not requiring the use of the differential input, both CLK and nCLK can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from CLK to ground.

LVCMOS CONTROL PINS:

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

OUTPUTS:

LVCMOS OUTPUT:

All unused LVCMOS output can be left floating. We recommend that there is no trace attached.

DIFFERENTIAL CLOCK INPUT INTERFACE

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figures 4A to 4E show interface examples for the HiPerClockS CLK/nCLK input driven by the most common driver types. The input interfaces suggested

here are examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 2A*, the input termination applies for ICS HiPerClockS LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

SCHEMATIC EXAMPLE

Figure 3 shows an application schematic example of the ICS87016. This schematic provides examples of input and output handling. The differential CLK1/nCLK1 input can accept various types of differential signal. This example shows the ICS87016 input driven by a 3.3V LVPECL driver. Additional examples for the input driven by other types of drivers

are shown in the application section of this data sheet. The single ended input CLK0 is driven by a 7Ω LVCMOS driver through series termination. The ICS87016 outputs are LVCMOS drivers. Series termination is shown in this schematic. Additional LVCMOS termination approaches are shown in the LVCMOS Termination Application Note.
