

128K x 36, 256K x 18
3.3V Synchronous ZBT™ SRAMs
2.5V I/O, Burst Counter
Pipelined Outputs

IDT71V2556
IDT71V2558

Features

- ◆ 128K x 36, 256K x 18 memory configurations
- ◆ Supports high performance system speed - 200 MHz (3.2 ns Clock-to-Data Access)
- ◆ ZBT™ Feature - No dead cycles between write and read cycles
- ◆ Internally synchronized output buffer enable eliminates the need to control $\overline{OE}$
- ◆ Single $R/\overline{W}$ (READ/WRITE) control pin
- ◆ Positive clock-edge triggered address, data, and control signal registers for fully pipelined applications
- ◆ 4-word burst capability (interleaved or linear)
- ◆ Individual byte write ($\overline{BW}_1$ - $\overline{BW}_4$) control (May tie active)
- ◆ Three chip enables for simple depth expansion
- ◆ 3.3V power supply ($\pm 5\%$)
- ◆ 2.5V I/O Supply (V_{DDQ})
- ◆ Packaged in a JEDEC standard 100-pin plastic thin quad flatpack (TQFP), 119 ball grid array (BGA) and 165 fine pitch ball grid array (fBGA)

Description

The IDT71V2556/58 are 3.3V high-speed 4,718,592-bit (4.5 Mega-bit) synchronous SRAMs. They are designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Thus, they have been given the name ZBT™, or Zero Bus Turnaround.

Address and control signals are applied to the SRAM during one clock

cycle, and two cycles later the associated data cycle occurs, be it read or write.

The IDT71V2556/58 contain data I/O, address and control signal registers. Output enable is the only asynchronous signal and can be used to disable the outputs at any given time.

A Clock Enable ($\overline{CEN}$) pin allows operation of the IDT71V2556/58 to be suspended as long as necessary. All synchronous inputs are ignored when ($\overline{CEN}$) is high and the internal device registers will hold their previous values.

There are three chip enable pins ($\overline{CE}_1$, CE_2 , $\overline{CE}_2$) that allow the user to deselect the device when desired. If any one of these three are not asserted when $ADV/\overline{LD}$ is low, no new memory operation can be initiated. However, any pending data transfers (reads or writes) will be completed. The data bus will tri-state two cycles after chip is deselected or a write is initiated.

The IDT71V2556/58 has an on-chip burst counter. In the burst mode, the IDT71V2556/58 can provide four cycles of data for a single address presented to the SRAM. The order of the burst sequence is defined by the $\overline{LBO}$ input pin. The $\overline{LBO}$ pin selects between linear and interleaved burst sequence. The $ADV/\overline{LD}$ signal is used to load a new external address ($ADV/\overline{LD} = \text{LOW}$) or increment the internal burst counter ($ADV/\overline{LD} = \text{HIGH}$).

The IDT71V2556/58 SRAMs utilize IDT's latest high-performance CMOS process and are packaged in a JEDEC standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) as well as a 119 ball grid array (BGA) and a 165 fine pitch ball grid array (fBGA).

Pin Description Summary

A0-A17	Address Inputs	Input	Synchronous
$\overline{CE}_1$, CE_2 , $\overline{CE}_2$	Chip Enables	Input	Synchronous
$\overline{OE}$	Output Enable	Input	Asynchronous
$R/\overline{W}$	Read/Write Signal	Input	Synchronous
$\overline{CEN}$	Clock Enable	Input	Synchronous
$\overline{BW}_1$, $\overline{BW}_2$, $\overline{BW}_3$, $\overline{BW}_4$	Individual Byte Write Selects	Input	Synchronous
CLK	Clock	Input	N/A
$ADV/\overline{LD}$	Advance burst address / Load new address	Input	Synchronous
$\overline{LBO}$	Linear / Interleaved Burst Order	Input	Static
I/O0-I/O31, I/O P1-I/O P4	Data Input / Output	I/O	Synchronous
V_{DD} , V_{DDQ}	Core Power, I/O Power	Supply	Static
V_{SS}	Ground	Supply	Static

4875 tbl 01

Pin Definitions⁽¹⁾

Symbol	Pin Function	I/O	Active	Description
A0-A17	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK, ADV/LD low, CEN low, and true chip enables.
ADV/LD	Advance / Load	I	N/A	ADV/LD is a synchronous input that is used to load the internal registers with new address and control when it is sampled low at the rising edge of clock with the chip selected. When ADV/LD is low with the chip deselected, any burst in progress is terminated. When ADV/LD is sampled high then the internal burst counter is advanced for any burst that was in progress. The external addresses are ignored when ADV/LD is sampled high.
R/W	Read / Write	I	N/A	R/W signal is a synchronous input that identifies whether the current load cycle initiated is a Read or Write access to the memory array. The data bus activity for the current cycle takes place two clock cycles later.
CEN	Clock Enable	I	LOW	Synchronous Clock Enable Input. When CEN is sampled high, all other synchronous inputs, including clock are ignored and outputs remain unchanged. The effect of CEN sampled high on the device outputs is as if the low to high clock transition did not occur. For normal operation, CEN must be sampled low at rising edge of clock.
BW1-BW4	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. Each 9-bit byte has its own active low byte write enable. On load write cycles (When R/W and ADV/LD are sampled low) the appropriate byte write signal (BW1-BW4) must be valid. The byte write signal must also be valid on each cycle of a burst write. Byte Write signals are ignored when R/W is sampled high. The appropriate byte(s) of data are written into the device two cycles later. BW1-BW4 can all be tied low if always doing write to the entire 36-bit word.
CE1, CE2	Chip Enables	I	LOW	Synchronous active low chip enable. CE1 and CE2 are used with CE2 to enable the IDT71V2556/58. (CE1 or CE2 sampled high or CE2 sampled low) and ADV/LD low at the rising edge of clock, initiates a deselect cycle. The ZBT™ has a two cycle deselect, i.e., the data bus will tri-state two clock cycles after deselect is initiated.
CE2	Chip Enable	I	HIGH	Synchronous active high chip enable. CE2 is used with CE1 and CE2 to enable the chip. CE2 has inverted polarity but otherwise identical to CE1 and CE2.
CLK	Clock	I	N/A	This is the clock input to the IDT71V2556/58. Except for OE, all timing references for the device are made with respect to the rising edge of CLK.
I/O0-I/O31 I/OP1-I/OP4	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. Both the data input path and data output path are registered and triggered by the rising edge of CLK.
LBO	Linear Burst Order	I	LOW	Burst order selection input. When LBO is high the Interleaved burst sequence is selected. When LBO is low the Linear burst sequence is selected. LBO is a static input and it must not change during device operation.
OE	Output Enable	I	LOW	Asynchronous output enable. OE must be low to read data from the 71V2556/58. When OE is high the I/O pins are in a high-impedance state. OE does not need to be actively controlled for read and write cycles. In normal operation, OE can be tied low.
VDD	Power Supply	N/A	N/A	3.3V core power supply.
VDDQ	Power Supply	N/A	N/A	2.5V I/O Supply.
VSS	Ground	N/A	N/A	Ground.

NOTE:

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

Functional Block Diagram

Functional Block Diagram

Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{DD}	Core Supply Voltage	3.135	3.3	3.465	V
V_{DDQ}	I/O Supply Voltage	2.375	2.5	2.625	V
V_{SS}	Supply Voltage	0	0	0	V
V_{IH}	Input High Voltage - Inputs	1.7	—	$V_{DD} + 0.3$	V
V_{IH}	Input High Voltage - I/O	1.7	—	$V_{DDQ} + 0.3^{(2)}$	V
V_{IL}	Input Low Voltage	$-0.3^{(1)}$	—	0.7	V

NOTES:

- V_{IL} (min.) = $-1.0V$ for pulse width less than $t_{cyc}/2$, once per cycle.
- V_{IH} (max.) = $+6.0V$ for pulse width less than $t_{cyc}/2$, once per cycle.

Recommended Operating Temperature and Supply Voltage

Grade	Temperature ⁽¹⁾	V _{SS}	V _{DD}	V _{DDQ}
Commercial	0°C to +70°C	0V	3.3V±5%	2.5V±5%
Industrial	-40°C to +85°C	0V	3.3V±5%	2.5V±5%

NOTES:

4875 tbl 06

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DD} terminals only.
- V_{DDQ} terminals only.
- Input terminals only.
- I/O terminals only.
- This is a steady-state DC parameter that applies after the power supply has reached its nominal operating value. Power sequencing is not necessary; however, the voltage on any input or I/O pin cannot exceed V_{DDQ} during power supply ramp up.
- T_A is the "instant on" case temperature.

L	X	X	H	X	X	DESELECT / NOOP	NOOP	HiZ
H	X	X	X	X	X	X	SUSPEND ⁽⁴⁾	Previous Value

4875 tbl 08

NOTES:

1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. When ADV/ $\overline{\text{LD}}$ signal is sampled high, the internal burst counter is incremented. The R/ $\overline{\text{W}}$ signal is ignored when the counter is advanced. Therefore the nature of the burst cycle (Read or Write) is determined by the status of the R/ $\overline{\text{W}}$ signal when the first address is loaded at the beginning of the burst cycle.
3. Deselect cycle is initiated when either ($\overline{\text{CE}}_1$, or $\overline{\text{CE}}_2$ is sampled high or CE₂ is sampled low) and ADV/ $\overline{\text{LD}}$ is sampled low at rising edge of clock. The data bus will tri-state two cycles after deselect is initiated.
4. When $\overline{\text{CEN}}$ is sampled high at the rising edge of clock, that clock edge is blocked from propagating through the part. The state of all the internal registers and the I/Os remains unchanged.
5. To select the chip requires $\overline{\text{CE}}_1 = \text{L}$, $\overline{\text{CE}}_2 = \text{L}$, CE₂ = H on these chip enables. Chip is deselected if any one of the chip enables is false.
6. Device Outputs are ensured to be in High-Z after the first rising edge of clock upon power-up.
7. Q - Data read from the device, D - data written to the device.

Partial Truth Table for Writes⁽¹⁾

OPERATION	R/ $\overline{\text{W}}$	$\overline{\text{BW}}_1$	$\overline{\text{BW}}_2$	$\overline{\text{BW}}_3^{(3)}$	$\overline{\text{BW}}_4^{(3)}$
READ	H	X	X	X	X
WRITE ALL BYTES	L	L	L	L	L
WRITE BYTE 1 (I/O[0:7], I/OP ₁) ⁽²⁾	L	L	H	H	H
WRITE BYTE 2 (I/O[8:15], I/OP ₂) ⁽²⁾	L	H	L	H	H
WRITE BYTE 3 (I/O[16:23], I/OP ₃) ^(2,3)	L	H	H	L	H
WRITE BYTE 4 (I/O[24:31], I/OP ₄) ^(2,3)	L	H	H	H	L
NO WRITE	L	H	H	H	H

4875 tbl 09

NOTES:

1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. Multiple bytes may be selected during the same cycle.
3. N/A for X18 configuration.

Interleaved Burst Sequence Table ($\overline{\text{LB0}}=\text{VDD}$)

	Sequence 1		Sequence 2		Sequence 3		Sequence 4

Functional Timing Diagram⁽¹⁾

4875 drw 03

NOTES:

1. This assumes $\overline{\text{CEN}}$, $\overline{\text{CE1}}$, CE2 , $\overline{\text{CE2}}$ are all true.
2. All Address, Control and Data_In are only required to meet set-up and hold time with respect to the rising edge of clock. Data_Out is valid after a clock-to-data delay from the rising edge of clock.

4875 tbl 21

NOTE:

- The $\overline{LBO}$ pin will be internally pulled to V_{DD} if it is not actively driven in the application.

DC Electrical Characteristics Over the Operating Temperature Supply Voltage Range⁽¹⁾ ($V_{DD} = 3.3V \pm 5\%$)

Symbol	Parameter	Test Conditions	200MHz	166MHz		133MHz		100MHz		Unit
			Com'l Only	Com'l	Ind	Com'l	Ind	Com'l	Ind	
I_{DD}	Operating Power Supply Current	Device Selected, Outputs Open, $ADV/LD = X$, $V_{DD} = \text{Max.}$, $V_{IN} \geq V_{IH}$ or $\leq V_{IL}$, $f = f_{MAX}$ ⁽²⁾	400	350	360	300	310	250	260	mA
I_{SB1}	CMOS Standby Power Supply Current	Device Deselected, Outputs Open, $V_{DD} = \text{Max.}$, $V_{IN} \geq V_{HD}$ or $\leq V_{LD}$, $f = 0$ ^(2,3)	40	40	45	40	45	40	45	mA
I_{SB2}	Clock Running Power Supply Current	Device Deselected, Outputs Open, $V_{DD} = \text{Max.}$, $V_{IN} \geq V_{HD}$ or $\leq V_{LD}$, $f = f_{MAX}$ ^(2,3)	130	120	130	110	120	100	110	mA
I_{SB3}	Idle Power Supply Current	Device Selected, Outputs Open, $\overline{CEN} \geq V_{IH}$, $V_{DD} = \text{Max.}$, $V_{IN} \geq V_{HD}$ or $\leq V_{LD}$, $f = f_{MAX}$ ^(2,3)	40	40	45	40	45	40	45	mA

4875 tbl 22

NOTES:

- All values are maximum guaranteed values.
- At $f = f_{MAX}$, inputs are cycling at the maximum frequency of read cycles of $1/t_{CYC}$; $f=0$ means no input lines are changing.
- For I/Os $V_{HD} = V_{DDQ} - 0.2V$, $V_{LD} = 0.2V$. For other inputs $V_{HD} = V_{DD} - 0.2V$, $V_{LD} = 0.2V$.

NOTES:

4875 tbl 24

- t_F = 1/t_{CYC}.
- Measured as HIGH above 0.6V_{DDQ} and LOW below 0.4V_{DDQ}.
- Transition is measured ±200mV from steady-state.
- These parameters are guaranteed with the AC load (Figure 1) by device characterization. They are not production tested.
- To avoid bus contention, the output buffers are designed such that t_{CHZ} (device turn-off) is about 1ns faster than t_{CLZ} (device turn-on) at a given temperature and voltage. The specs as shown do not imply bus contention because t_{CLZ} is a Min. parameter that is worse case at totally different test conditions (0 deg. C, 3.465V) than t_{CHZ}, which is a Max. parameter (worse case at 70 deg. C, 3.135V).

Timing Waveform of Read Cycle^(1,2,3,4)

4875 drw 06

NOTES:

1. $Q(A_1)$ represents the first output from the external address A_1 . $Q(A_2)$ represents the first output from the external address A_2 ; $Q(A_2+1)$ represents the next output data in the burst sequence of the base address A_2 , etc. where address bits A_0 and A_1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE_1}$ and $\overline{CE_2}$ signals. For example, when $\overline{CE_1}$ and $\overline{CE_2}$ are LOW on this waveform, CE_2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/LD LOW.
4. R/W is don't care when the SRAM is bursting (ADV/LD sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/W signal when new address and control are loaded into the SRAM.

Timing Waveform of Write Cycles(1,2,3,4,5)

NOTES:

1. $D(A_1)$ represents the first input to the external address A_1 . $D(A_2)$ represents the first input to the external address A_2 . $D(A_{2+1})$ represents the next input data in the burst sequence of the base address A_2 , etc. where address bits A_0 and A_1 are advancing for the four word burst in the sequence defined by the state of the $\overline{LB0}$ input.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE_1}$ and $\overline{CE_2}$ signals. For example, when $\overline{CE_1}$ and $\overline{CE_2}$ are LOW on this waveform, CE_2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling $\overline{ADV/LD}$ LOW.
4. R/W is don't care when the SRAM is bursting ($\overline{ADV/LD}$ sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/W signal when new address and control are loaded into the SRAM.
5. Individual Byte Write signals ($\overline{BWx}$) must be valid on all write and burst-write cycles. A write cycle is initiated when R/W signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of Combined Read and Write Cycles (1,2,3)

4875 clw 08

NOTES:

1. Q (A1) represents the first output from the external address A1. D (A2) represents the input data to the SRAM corresponding to address A2.
2. CE2 timing transitions are identical but inverted to the CE1 and OE2 signals. For example, when CE1 and OE2 are LOW on this waveform, CE2 is HIGH.
3. Individual Byte Write signals (BWx) must be valid on all write and burst-write cycles. A write cycle is initiated when RW signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of $\overline{\text{CEN}}$ Operation^(1,2,3,4)

4875 d1w 09

NOTES:

1. Q (A1) represents the first output from the external address A1. D (A2) represents the input data to the SRAM corresponding to address A2.
2. $\overline{\text{CE}}_2$ timing transitions are identical but inverted to the $\overline{\text{CE}}_1$ and $\overline{\text{CE}}_2$ signals. For example, when $\overline{\text{CE}}_1$ and $\overline{\text{CE}}_2$ are LOW on this waveform, $\overline{\text{CE}}_2$ is HIGH.
3. $\overline{\text{CEN}}$ when sampled high on the rising edge of clock will block that L-H transition of the clock from propagating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals ($\overline{\text{BW}}_x$) must be valid on all write and burst-write cycles. A write cycle is initiated when $\overline{\text{R/W}}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of $\overline{CS}$ Operation^(1,2,3,4)

4875 drw 10

NOTES:

1. Q(A₁) represents the first output from the external address A₁. D(A₃) represents the input data to the SRAM corresponding to address A₃.
2. CE₂ timing transitions are identical but inverted to the CE₁ and CE₂ signals. For example, when CE₁ and CE₂ are LOW on this waveform, CE₂ is HIGH.
3. $\overline{CEN}$ when sampled high on the rising edge of clock will block that L-H transition of the clock from propagating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals ($\overline{BWx}$) must be valid on all write and burst-write cycles. A write cycle is initiated when $\overline{RW}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

100 Pin Plastic Thin Quad Flatpack (TQFP) Package Diagram Outline

SYMBOL	JEDEC VARIATION			NOTE
	MIN	NOM	MAX	
A	—	—	1.60	
A1	.05	.10	.15	
A2	1.35	1.40	1.45

b1	.22	.30	.33	
ccc	—	—	.10	
ddd	—	—	.13	

NOTES:

- ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M-1982
- TOP PACKAGE MAY BE SMALLER THAN BOTTOM PACKAGE BY .15 mm
- DATUMS [A-B] AND [D-] TO BE DETERMINED AT DATUM PLANE [H-]
- DIMENSIONS D AND E ARE TO BE DETERMINED AT SEATING PLANE [C-]
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE MOLD PROTRUSION IS .25 mm PER SIDE. D1 AND E1 ARE MAXIMUM BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH
- DETAILS OF PIN 1 IDENTIFIER IS OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED
- DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION IS .08 mm IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.
- EXACT SHAPE OF EACH CORNER IS OPTIONAL
- THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN .10 AND .25 mm FROM THE LEAD TIP
- ALL DIMENSIONS ARE IN MILLIMETERS
- THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MO-136, VARIATION DJ AND BX

Datasheet Document History

6/30/99		Updated to new format
8/23/99		Added Smart ZBT functionality
	Pp. 4, 5	Added Note 4 and changed Pins 38, 42, and 43 to DNU
	Pg. 6	Changed U2–U6 to DNU
	Pg. 14	Added Smart ZBT AC Electrical Characteristics
	Pg. 15	Improved t_{CD} and $t_{OE(MAX)}$ at 166MHz
		Revised $t_{CHZ(MIN)}$ for $f \leq 133$ MHz
		Revised $t_{OHZ(MAX)}$ for $f \leq 133$ MHz
		Improved t_{CH} , t_{CL} for $f \leq 166$ MHz
		Improved setup times for 100–200 MHz
	Pg. 22	Added BGA package diagrams
	Pg. 24	Added Datasheet Document History
10/4/99	Pg. 14	Revised AC Electrical Characteristics table
	Pg. 15	Revised t_{CHZ} to match t_{CLZ} and t_{CDC} at 133MHz and 100MHz
12/31/99		Removed Smart functionality
		Added Industrial Temperature range offerings at the 100 to 166MHz speed grades.
04/30/00	Pg. 5,6	Add clarification note to Recommended Temperature Ratings and Absolute Max Ratings table; Add note to TQFP Pin Configurations
	Pg. 6	Add BGA Capacitance table
	Pg. 7	Add note to BGA Pin Configurations
	Pg. 21	Insert TQFP Package Diagram Outline
05/26/00		Add new package offering, 13 x 15mm 165fBGA
	Pg. 23	Correct 119 BGA Package Diagram Outline
07/26/00	Pg. 5,6,7	Add zz, sleep mode reference note to TQFP, BG119 and BQ165 pinouts
	Pg. 8	Update BQ165 pinout
	Pg. 23	Update BG119 package diagram outlines
10/25/00		Remove Preliminary Status
	Pg. 8	Add note to pin N5, BQ165 pinout reserved for JTAG $\overline{TRST}$
