*DP8392C DP8392C-1 CTI Coaxial Transceiver Interface*

Literature Number: SNLS078A

## DP8392C/DP8392C-1 CTI Coaxial Transceiver Interface

### General Description

The DP8392C Coaxial Transceiver Interface (CTI) is a coaxial cable line driver/receiver for Ethernet/Thin Ethernet (Cheapernet) type local area networks. The CTI is connected between the coaxial cable and the Data Terminal Equipment (DTE). In Ethernet applications the transceiver is usually mounted within a dedicated enclosure and is connected to the DTE via a transceiver cable. In Cheapernet applications, the CTI is typically located within the DTE and connects to the DTE through isolation transformers only. The CTI consists of a Receiver, Transmitter, Collision Detector, and a Jabber Timer. The Transmitter connects directly to a 50 ohm coaxial cable where it is used to drive the coax when transmitting. During transmission, a jabber timer is initiated to disable the CTI transmitter in the event of a longer than legal length data packet. Collision Detection circuitry monitors the signals on the coax to determine the presence of colliding packets and signals the DTE in the event of a collision.

The CTI is part of a three chip set that implements the complete IEEE 802.3 compatible network node electronics as shown below. The other two chips are the DP8391 Serial Network Interface (SNI) and the DP8390 Network Interface Controller (NIC).

The SNI provides the Manchester encoding and decoding functions; whereas the NIC handles the Media Access Protocol and the buffer management tasks. Isolation between the CTI and the SNI is an IEEE 802.3 requirement that can be easily satisfied on signal lines using a set of pulse transformers that come in a standard DIP. However, the power isolation for the CTI is done by DC-to-DC conversion through a power transformer.

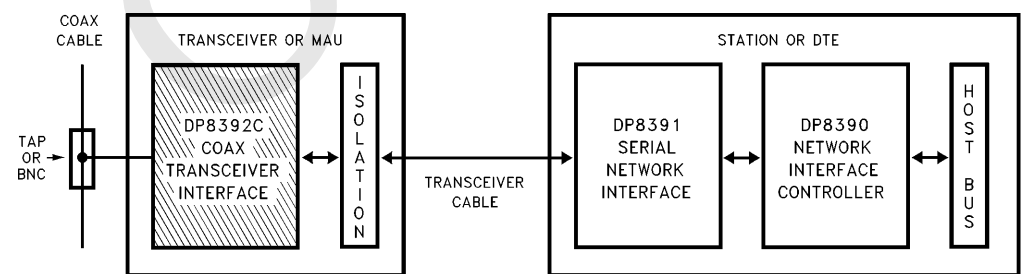

### Features

- Compatible with Ethernet II, IEEE 802.3 10Base5 and 10Base2 (Cheapernet)
- Integrates all transceiver electronics except signal & power isolation
- Innovative design minimizes external component count
- Jabber timer function integrated on chip
- Externally selectable CD Heartbeat allows operation with IEEE 802.3 compatible repeaters
- Precision circuitry implements receive mode collision detection
- Squelch circuitry at all inputs rejects noise
- Designed for rigorous reliability requirements of IEEE 802.3
- Standard Outline 16-pin DIP uses a special leadframe that significantly reduces the operating die temperature

## 3.0 Functional Description

The CTI consists of four main logical blocks:

- a) the Receiver - receives data from the coax and sends it to the DTE
- b) the Transmitter - accepts data from the DTE and transmits it onto the coax
- c) the Collision Detect circuitry - indicates to the DTE any collision on the coax
- d) the Jabber Timer - disables the Transmitter in case of longer than legal length packets

### 3.1 RECEIVER FUNCTIONS

The Receiver includes an input buffer, a cable equalizer, a 4-pole Bessel low pass filter, a squelch circuit, and a differential line driver.

The buffer provides high input impedance and low input capacitance to minimize loading and reflections on the coax.

The equalizer is a high pass filter which compensates for the low pass effect of the cable. The composite result of the maximum length cable and the equalizer is a flatband response at the signal frequencies to minimize jitter.

The 4-pole Bessel low pass filter extracts the average DC level on the coax, which is used by both the Receiver squelch and the collision detection circuits.

The Receiver squelch circuit prevents noise on the coax from falsely triggering the Receiver in the absence of the signal. At the beginning of the packet, the Receiver turns on when the DC level from the low pass filter is lower than the DC squelch threshold. However, at the end of the packet, a quick Receiver turn off is needed to reject dribble bits. This is accomplished by an AC timing circuit that reacts to high level signals of greater than typically 200 ns in duration. The

Receiver then stays off only if within about 1  $\mu$ s, the DC level from the low pass filter rises above the DC squelch threshold. *Figure 2* illustrates the Receiver timing.

The differential line driver provides ECL compatible signals to the DTE with typically 3 ns rise and fall times. In its idle state, its outputs go to differential zero to prevent DC standing current in the isolation transformer.

### 3.2 TRANSMITTER FUNCTIONS

The Transmitter has a differential input and an open collector output current driver. The differential input common mode voltage is established by the CTI and should not be altered by external circuitry. The transformer coupling of TX $\pm$  will satisfy this condition. The driver meets all IEEE 802.3/Ethernet Specifications for signal levels. Controlled rise and fall times (25 ns V  $\pm$  5 ns) minimize the higher harmonic components. The rise and fall times are matched to minimize jitter. The drive current levels of the DP8392C meet the tighter recommended limits of IEEE 802.3 and are set by a built-in bandgap reference and an external 1% resistor. An on chip isolation diode is provided to reduce the Transmitter's coax load capacitance. For Ethernet compatible applications, an external isolation diode (see *Figure 4*) may be added to further reduce coax load capacitance. In Cheapernet compatible applications the external diode is not required as the coax capacitive loading specifications are relaxed.

The Transmitter squelch circuit rejects signals with pulse widths less than typically 20 ns (negative going), or with levels less than -175 mV. The Transmitter turns off at the end of the packet if the signal stays higher than -175 mV for more than approximately 300 ns. *Figure 3* illustrates the Transmitter timing.

## 3.0 Functional Description (Continued)

### 3.3 COLLISION FUNCTIONS

The collision circuitry consists of two buffers, two 4-pole Bessel low pass filters (section 3.1), a comparator, a heartbeat generator, a 10 MHz oscillator, and a differential line driver.

Two identical buffers and 4-pole Bessel low pass filters extract the DC level on the center conductor (data) and the shield (sense) of the coax. These levels are monitored by the comparator. If the data level is more negative than the sense level by at least the collision threshold ( $V_{th}$ ), the collision output is enabled.

At the end of every transmission, the heartbeat generator creates a pseudo collision for a short time to ensure that the collision circuitry is properly functioning. This burst on collision output occurs typically  $1.1 \mu s$  after the transmission, and has a duration of about  $1 \mu s$ . This function can be disabled externally with the HBE (Heartbeat Enable) pin to allow operation with repeaters.

The 10 MHz oscillator generates the signal for the collision and heartbeat functions. It is also used as the timebase for all the jabber functions. It does not require any external components.

The collision differential line driver transfers the 10 MHz signal to the  $CD \pm$  pair in the event of collision, jabber, or heartbeat conditions. This line driver also features zero differential idle state.

### 3.4 JABBER FUNCTIONS

The Jabber Timer monitors the Transmitter and inhibits transmission if the Transmitter is active for longer than 20 ms (fault). It also enables the collision output for the fault duration. After the fault is removed, The Jabber Timer waits for about 500 ms (unjab time) before re-enabling the Transmitter. The transmit input must stay inactive during the unjab time.

## 6.0 Pin Descriptions

28-Pin PLCC	16-Pin DIP	Name	I/O	Description
2 3	1 2	CD+* CD—	O	<b>Collision Output.</b> Balanced differential line driver outputs from the collision detect circuitry. The 10 MHz signal from the internal oscillator is transferred to these outputs in the event of collision, excessive transmission (jabber), or during CD Heartbeat condition. These outputs are open emitters; pulldown resistors to VEE are required. When operating into a 78Ω transmission line, these resistors should be 500Ω. In Cheapernet applications, where the 78Ω drop cable is not used, higher resistor values (up to 1.5k) may be used to save power.
4 12	3 6	RX+* RX—	O	<b>Receive Output.</b> Balanced differential line driver outputs from the Receiver. These outputs also require 500Ω pulldown resistors.
13 14	7 8	TX+* TX—	I	<b>Transmit Input.</b> Balanced differential line receiver inputs to the Transmitter. The common mode voltage for these inputs is determined internally and must not be externally established. Signals meeting Transmitter squelch requirements are waveshaped and output at TXO.
15	9	HBE	I	<b>Heartbeat Enable.</b> This input enables CD Heartbeat when grounded, disables it when connected to VEE.
18 19	11 12	RR+ RR—	I	<b>External Resistor.</b> A fixed 1k 1% resistor connected between these pins establishes internal operating currents.
26	14	RXI	I	<b>Receive Input.</b> Connects directly to the coaxial cable. Signals meeting Receiver squelch requirements are equalized for inter-symbol distortion, amplified, and outputted at RX±.
28	15	TXO	O	<b>Transmit Output.</b> Connects either directly (Cheapernet) or via an isolation diode (Ethernet) to the coaxial cable.
1	16	CDS	I	<b>Collision Detect Sense.</b> Ground sense connection for the collision detect circuit. This pin should be connected separately to the shield to avoid ground drops from altering the receive mode collision threshold.
16, 17	10	GND		<b>Positive Supply Pin.</b> A 0.1 μF ceramic decoupling capacitor must be connected across GND and VEE as close to the device as possible.
5–11 20–25	4 5 13	VEE		<b>Negative Supply Pins.</b> In order to make full use of the 3.5W power dissipation capability of this package, these pins should be connected to a large metal frame area on the PC board. Doing this will reduce the operating die temperature of the device thereby increasing the long term reliability.

\*IEEE names for CD± = CI±, RX± = DI±, TX± = DO±

### 6.1 P.C. BOARD LAYOUT

The DP8392C package is uniquely designed to ensure that the device meets the 1 million hour Mean Time Between Failure (MTBF) requirement of the IEEE 802.3 standard. In order to fully utilize this heat dissipation design, the three VEE pins are to be connected to a copper plane which should be included in the printed circuit board layout.

There are two basic considerations in designing a PCB for the DP8392C and C-1 CTI. The first is ensuring that the layout does not degrade the electrical characteristics of the DP8392, and enables the end product to meet the IEEE 802.3 specifications. The second consideration is meeting the thermal requirements to the DP8392.

Since the DP8392 is highly integrated the layout is actually quite simple, and there are just a few guidelines:

1. Ensure that the parasitic capacitance added to the RXI and TXO pins is minimized. To do this keep these signal traces short, and remove any power planes under these signals, and under any components that connect to these signals. *Figure 6* shows the component placement for the DIP package. The PLCC component placement would be similar, as shown in *Figure 7*.

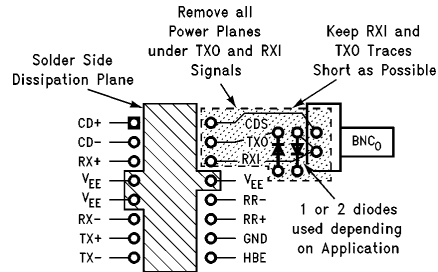

2. The power supply layout to the CTI should be relatively clean. Usually the CTI's power is supplied directly by a DC-DC converter. The power should be routed either through separate isolated planes, or via thick PCB traces.

For the second consideration, the packaged DP8392 must have a thermal resistance of 40°C–45°C/W to meet the full 0°C–70°C temperature range. The CTI dissipates more power when transmitting than while it is idle. In order to do this the thermal resistance of the device must be 40°C–45°C/W. To meet this requirement during transmission, it is recommended that a small printed circuit board plane be connected to all VEE pins on the solder side of the PCB.

The size of the trace plane depends on the package used and the duty cycle of transmissions. For the DIP package the plane should be connected to pins 4–5, 13, and the size should be approximately 0.2 square inches for applications where the duty cycle of the transmitter is very low (<10%). This would be typical of adapter or motherboard applications. In applications where the transmitter duty cycle may be large (repeaters and external transceivers) the total area should be increased to 0.4 in<sup>2</sup>. *Figure 6* illustrates a recommended component side layout for these planes.

## 6.0 Pin Descriptions (Continued)

For the PLCC packaged DP8392, it is recommended that a small printed circuit board  $V_{EE}$  plane be connected to pins 5–11, and a second one be connected to pins 20–25. To reduce the thermal resistance to the required value, the area of the plane on EACH set of pins should be  $\geq 0.20 \text{ in}^2$  for applications with low transmitter duty cycle, and  $\geq 0.4 \text{ in}^2$  for high transmit duty cycle applications. *Figure 7* illustrates a recommended component side layout for these planes.

## 7.0 Absolute Maximum Ratings (Note 1)

Supply Voltage ( $V_{EE}$ )	–12V
Package Power Rating at 25°C (PC Board Mounted)	3.5 Watts* See Section 5
Derate linearly at the rate of 28.6 mW/°C	
Input Voltage	0 to –12V
Storage Temperature	–65° to 150°C
Lead Temp. (Soldering, 10 seconds)	260°C

\*For actual power dissipation of the device please refer to section 7.0.

## Recommended Operating Conditions

Supply Voltage ( $V_{EE}$ )	–9V ± 5%
Ambient Temperature	0° to 70°C

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

## 8.0 DP8392C Electrical Characteristics $V_{EE} = -9V \pm 5\%$ , $T_A = 0^\circ$ to 70°C (Notes 2 & 3)

All parameters with respect to CD ± and RX ± are measured after the pulse transformer except  $V_{OC}$ .

Symbol	Parameter	Min	Typ	Max	Units
$I_{EE1}$	Supply current out of $V_{EE}$ pin—non transmitting		–85	–130	mA
$I_{EE2}$	Supply current out of $V_{EE}$ pin—transmitting		–125	–180	mA
$I_{RXI}$	Receive input bias current (RXI)	–2		+25	μA
$I_{TDC}$	Transmit output dc current level (TXO)	37	41	45	mA
$I_{TAC}$	Transmit output ac current level (TXO)	±28		$I_{TDC}$	mA
$V_{CD}$	Collision threshold (Receive mode)	–1.45	–1.53	–1.58	V
$V_{OD}$	Differential output voltage (RX ±, CD ±)	±550		±1200	mV
$V_{OC}$	Common mode output voltage (RX ±, CD ±)	–1.5	–2.0	–2.5	V
$V_{OB}$	Diff. output voltage imbalance (RX ±, CD ±)			±40	mV
$V_{TS}$	Transmitter squelch threshold (TX ±)	–175	–225	–300	mV
$C_X$	Input capacitance (RXI)		1.2		pF
$R_{RXI}$	Shunt resistance—non transmitting (RXI)	100			KΩ
$R_{TXO}$	Shunt resistance—transmitting (TXO)		10		KΩ

## 9.0 DP8392C-1 Electrical Characteristics $V_{EE} = -9V \pm 5\%$ , $T_A = 0^\circ$ to 70°C (Notes 2 & 3)

All parameters with respect to CD ± and RX ± are measured after the pulse transformer except  $V_{OC}$ .

Symbol	Parameter	Min	Typ	Max	Units
$I_{EE1}$	Supply current out of $V_{EE}$ pin—non transmitting		–85	–130	mA
$I_{EE2}$	Supply current out of $V_{EE}$ pin—transmitting		–125	–180	mA
$I_{RXI}$	Receive input bias current (RXI)	–2		+25	μA
$I_{TDC}$	Transmit output dc current level (TXO)	37	41	45	mA
$I_{TAC}$	Transmit output ac current level (TXO)	±28		$I_{TDC}$	mA
$V_{CD}$	Collision threshold (Receive mode)	–1.45	–1.53	–1.58	V
$V_{OD}$	Differential output voltage (RX ±, CD ±)	±550		±1200	mV
$V_{OC}$	Common mode output voltage (RX ±, CD ±)	–1.5	–2.0	–2.5	V
$V_{OB}$	Diff. output voltage imbalance (RX ±, CD ±)			±40	mV
$V_{TS}$	Transmitter squelch threshold (TX ±)	–175	–225	–275	mV
$C_X$	Input capacitance (RXI)		1.2		pF
$R_{RXI}$	Shunt resistance—non transmitting (RXI)	100			KΩ
$R_{TXO}$	Shunt resistance—transmitting (TXO)	7.5K	10		KΩ

**Note 1:** Absolute maximum ratings are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits.

**Note 2:** All currents into device pins are positive, all currents out of device pins are negative. All voltages referenced to ground unless otherwise specified.

**Note 3:** All typicals are given for  $V_{EE} = -9V$  and  $T_A = 25^\circ C$ .

## 10.0 DP8392C Switching Characteristics $V_{EE} = -9V \pm 5\%$ , $T_A = 0^\circ$ to $70^\circ\text{C}$ (Note 3)

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
